Microbial Glycobiology Structures Relevance And Applications:

Microbial Glycobiology Anthony P Moran,2009-10-01 This book presents in an easy to read format a summary of the important central aspects of microbial glycobiology i e the study of carbohydrates as related to the biology of microorganisms Microbial glycobiology represents a multidisciplinary and emerging area with implications for a range of basic and applied research fields as well as having industrial medical and biotechnological implications Individual chapters provided by leading international scientists in the field yield insightful concise and stimulating reviews Provides researchers with an overview and synthesis of the latest research Each chapter begins with a brief 200 word Summary Abstract detailing the topic and focus of the chapter as well as the concepts to be addressed Allows researchers to see at a glance what each chapter will cover Each chapter includes a Research Focus Box Identifies important problems that still need to be solved and areas that require further investigation Prokaryotic Cell Wall Compounds Helmut König,Harald Claus,Ajit Varma,2010-03-18

Microbial cell wall structures play a significant role in maintaining cells shape as protecting layers against harmful agents in cell adhesion and in positive and negative biological activities with host cells All prokaryotes whether they are bacteria or archaea rely on their surface polymers for these multiple functions Their surfaces serve as the indispensable primary interfaces between the cell and its surroundings often mediating or catalyzing important interactions Prokaryotic Cell Wall Compounds summarizes the current state of knowledge on the prokaryotic cell wall Topics concerning bacterial and archaeal polymeric cell wall structures biological activities growth and inhibition cell wall interactions and the applications of cell wall components especially in the field of nanobiotechnology are presented Bacterial Cell Wall Structure and Dynamics Tobias Dörr,Partick J. Moynihan,Christoph Mayer,2019-12-27 Bacterial cells are encased in a cell wall which is required to maintain cell shape and to confer physical strength to the cell The cell wall allows bacteria to cope with osmotic and environmental challenges and to secure cell integrity during all stages of bacterial growth and propagation and thus has to be sufficiently rigid Moreover to accommodate growth processes the cell wall at the same time has to be a highly dynamic structure During cell enlargement division and differentiation bacteria continuously remodel degrade and resynthesize their cell wall but pivotally need to assure cell integrity during these processes Finally the cell wall is also adjusted according to both environmental constraints and metabolic requirements However how exactly this is achieved is not fully understood The major structural component of the bacterial cell wall is peptidoglycan PG a mesh like polymer of glycan chains interlinked by short chain peptides constituting a net like macromolecular structure that has historically also termed murein or murein sacculus Although the basic structure of PG is conserved among bacteria considerable variations occur regarding cross bridging modifications and attachments Moreover different structural arrangements of the cell envelope exist within bacteria a thin PG layer sandwiched between an inner and outer membrane is present in Gram negative bacteria and a thick PG layer decorated with secondary glycopolymers including teichoic acids is present in Gram positive bacteria Furthermore even

more complex envelope structures exist such as those found in mycobacteria. Crucially all bacteria possess a multitude of often redundant lytic enzymes termed autolysins and other cell wall modifying and synthesizing enzymes allowing to degrade and rebuild the various structures covering the cells. However how cell wall turnover and cell wall biosynthesis are coordinated during different stages of bacterial growth is currently unclear. The mechanisms that prevent cell lysis during these processes are also unclear. This Research Topic focuses on the dynamics of the bacterial cell wall its modifications and structural rearrangements during cell growth and differentiation. It pays particular attention to the turnover of PG its breakdown and recycling as well as the regulation of these processes. Other structures for example secondary polymers such as teichoic acids which are dynamically changed during bacterial growth and differentiation are also covered. In recent years our view on the bacterial cell envelope has undergone a dramatic change that challenged old models of cell wall structure biosynthesis and turnover. This collection of articles aims to contribute to new understandings of bacterial cell wall structure and dynamics.

Bacterial Lipopolysaccharides Yuriy A. Knirel, Miguel A. Valvano, 2011-07-13. The bacterial lipopolysaccharide also known as endotoxin is exhaustively covered in the present work. Central emphasis is placed upon the fine chemical structure of the lipopolysaccharide and its significance for understanding their activity and function. In particular the role it plays in the interaction of bacteria with other biological systems is examined. New aspects of their physicochemical biology are introduced and updates to the current knowledge concerning the lipopolysaccharide are provided. This important class of biomolecules has recently attracted the attention of many investigators in particular for understanding its involvement in innate immunity toll like receptor recognition and intracellular signaling.

Microbial Exopolysaccharides: From Genes to Applications Jochen Schmid, Julia Fariña, Bernd Rehm, Volker Sieber, 2016-06-24. Microbial polysaccharides represent an attractive alternative to those from plants or macroalgae. They can be produced from renewable sources including lignocellulosic waste streams. Their production does not depend on geographical constraints and or seasonal limitations. Additionally the manipulation of biosynthetic pathways to enhance productivity or to influence the chemical polysaccharide composition is comparatively easy in bacteria. Microbial exopolysaccharides represents a valuable resource of biogenic and biodegradable polymers suitable to replace petro based polymers in various technical applications. Furthermore biocompatible exopolysaccharides are very attractive in medical applications such as drug delivery systems use as vaccines or nanoparticles. This research topic will depict the status quo as well as the future needs in the field of EPS and biofilm research. Starting from the unexplored diversity of microbial polysaccharide producers to production processes and possibilities for modifications to enhance the already high number of functionalities based on the chemical structures. An overview of the recent and future applications will be given and the necessity in unravelling the biosynthesis of microbial exopolysaccharide producers is depicted highlighting the future trend of tailor made polymers. Constraints in structure analysis of these highly complex biogenic polymers are described and different approaches to solve the restrictions in

imaging and NMR analysis will be given Therefore this research topic comprises the whole process from genes to applications

Glycobiology and Human Diseases Gherman Wiederschain,2016-02-22 This book discusses glycobiology and various forms of human diseases Topics covered include immunoglobulins inflammation and glycosylation the role and therapeutic significance of natural anti glycan antibodies in malignancies and in normal and aberrant pregnancy identifying urinary glycans as a possible method for the diagnosis of lysosomal st
