**Small Unmanned Aircraft** Randal W. Beard, Timothy W. McLain, 2012-02-26 Autonomous unmanned air vehicles UAVs are critical to current and future military civil and commercial operations Despite their importance no previous textbook has accessibly introduced UAVs to students in the engineering computer and science disciplines until now Small Unmanned Aircraft provides a concise but comprehensive description of the key concepts and technologies underlying the dynamics control and guidance of fixed wing unmanned aircraft and enables all students with an introductory level background in controls or robotics to enter this exciting and important area The authors explore the essential underlying physics and sensors of UAV problems including low level autopilot for stability and higher level autopilot functions of path planning The textbook leads the student from rigid body dynamics through aerodynamics stability augmentation and state estimation using onboard sensors to maneuvering through obstacles To facilitate understanding the authors have replaced traditional homework assignments with a simulation project using the MATLAB Simulink environment Students begin by modeling rigid body dynamics then add aerodynamics and sensor models They develop low level autopilot code extended Kalman filters for state estimation path following routines and high level path planning algorithms The final chapter of the book focuses on UAV guidance using machine vision Designed for advanced undergraduate or graduate students in engineering or the sciences this book offers a bridge to the aerodynamics and control of UAV flight *Малые беспилотные летательные аппараты: теория и практика* Тимоти МакЛэйн, Рэндал Биард, 2015-08-03 **Spaceflight Dynamics** William E. **Space Flight Dynamics** ,1994\* *Spacecraft Dynamics and Control* Anton H. de Ruiter,Christopher Damaren,James R. Forbes,2012-12-05 Provides the basics of spacecraft orbital dynamics plus attitude dynamics and control using vectrix notation Spacecraft Dynamics and Control An Introduction presents the fundamentals of classical control in the context of spacecraft attitude control This approach is particularly beneficial for the training of students in both of the subjects of classical control as well as its application to spacecraft attitude control By using a physical system a spacecraft that the reader can visualize rather than arbitrary transfer functions it is easier to grasp the motivation for why topics in control theory are important as well as the theory behind them The entire treatment of both orbital and attitude dynamics makes use of vectrix notation which is a tool that allows the user to write down any vector equation of motion without consideration of a reference frame This is particularly suited to the treatment of multiple reference frames Vectrix notation also makes a very clear distinction between a physical vector and its coordinate representation in a reference frame This is very important in spacecraft dynamics and control problems where often multiple coordinate representations are used in different reference frames for the same physical vector Provides an accessible practical aid for teaching and self study with a layout enabling a fundamental understanding of the subject Fills a gap in the existing literature by providing an analytical toolbox offering the reader a

lasting rigorous methodology for approaching vector mechanics a key element vital to new graduates and practicing engineers alike Delivers an outstanding resource for aerospace engineering students and all those involved in the technical aspects of design and engineering in the space sector Contains numerous illustrations to accompany the written text Problems are included to apply and extend the material in each chapter Essential reading for graduate level aerospace engineering students aerospace professionals researchers and engineers Essential Spaceflight Dynamics and Magnetospherics V. Rauschenbakh, M. Y. Ovchinnikov, Susan M.P. McKenna-Lawlor, 2014-03-14 Essential Spaceflight Dynamics and Magnetospherics describes in the first instance some of the key aspects of celestial mechanics and spaceflight dynamics It begins with classical two and three body problems illustrative of the aesthetic aspects of applying analytical methods of investigation to celestial mechanics Then osculating orbital elements are introduced as well as analysis techniques sufficient to evaluate the influence of various disturbing forces on spacecraft Next a theory of manoeuvres is outlined and the methodology of making interplanetary trajectory corrections Ideas involving various approaches to orbital element determinations using measured data are also considered The forces applied to a spacecraft can result in the development of torques that influence attitude motion and the effects of the most important of these are described in terms of equilibrium positions periodic motions steady state and transient motions Also considered is the problem of attitude control of a spacecraft using active and or passive methods of orientation and stabilization In addition a more advanced treatment of the development of attitude control systems is provided
