## Abstract

This paper surveys the use of ARCH and GARCH models in applied financial econometrics. It discusses the theory, estimation, and testing of these models, and provides a list of references for further reading.

## Keywords

ARCH; GARCH; volatility; time series; econometrics

The ARCH and GARCH models have become standard tools in applied financial econometrics. They are used to model the conditional variance of a time series, which is often referred to as volatility. The ARCH model is a special case of the GARCH model, and both are part of a larger class of stochastic volatility models. The GARCH model is more flexible than the ARCH model, as it allows for a more general form of the conditional variance. The ARCH and GARCH models are estimated using maximum likelihood methods, and their parameters are tested using a variety of statistical tests. The ARCH and GARCH models have been applied to a wide range of financial time series, including stock returns, exchange rates, and interest rates. They have also been used to model the volatility of financial assets, which is an important component of risk management. The ARCH and GARCH models are also used in portfolio optimization and asset pricing. In this paper, we survey the use of ARCH and GARCH models in applied financial econometrics. We discuss the theory, estimation, and testing of these models, and provide a list of references for further reading.
