by providing an efficient sustainable way to address some of the major challenges in shrimp farming. With a rising demand for shrimp in both local and international markets, this eBook is an invaluable resource for farmers, researchers, and students interested in innovative and eco-friendly shrimp culture techniques. The eBook begins by introducing the basics of Vannamei shrimp biology and the biofloc technology itself. It explains how biofloc systems leverage microorganisms to convert organic waste into a supplemental feed source for shrimp, significantly reducing operational costs such as feed. Moreover, biofloc technology allows for better water quality management, reducing the frequency of water changes and minimizing environmental impact. The book systematically guides readers from the biological fundamentals of shrimp to the technical application of biofloc systems. One of the strengths of this book is its focus on practical applications. Drawing from both scientific literature and field experiences, the authors provide detailed guidance on how to set up, manage, and maintain biofloc systems. Key topics include tank preparation, water management, microbial dynamics, and the proper handling of biofloc media. This structure ensures that farmers, whether novices or experienced practitioners, can apply biofloc technology effectively to optimize shrimp growth and health. The authors also cover the critical aspects of feed and nutrition management, particularly how biofloc serves as a supplemental feed source that can reduce reliance on commercial feed. Additionally, the book discusses shrimp health, disease prevention, and how the biofloc system naturally promotes stronger, healthier shrimp by improving immunity and reducing disease outbreaks. These insights are vital for shrimp farmers aiming for both higher productivity and sustainable practices. Further, the eBook explores the economic and environmental potential of biofloc technology. It outlines how farmers can maximize profits by reducing feed costs and increasing stocking densities without sacrificing shrimp health or environmental quality. By using biofloc systems, farmers can contribute to more sustainable shrimp farming, addressing both the economic challenges and the environmental concerns associated with conventional aquaculture methods. Overall, *Vannamei Culture in Biofloc: An Approach* serves as an essential reference for those involved in the shrimp aquaculture industry. Its blend of scientific theory and practical instruction offers a clear path to more efficient and sustainable shrimp farming. Whether for academic purposes or field application, this book is a valuable tool for advancing biofloc-based aquaculture, helping farmers achieve higher yields while preserving water resources and minimizing environmental impact.

**Microbial Composition in Biofloc-based Shrimp Aquaculture Systems** Thanh Loan Doan, 2019. Microbiology in shrimp culture with Biofloc. Shrimp disease outbreaks such as EMS can occur at the early post-stocking stage due to the presence of opportunistic pathogenic bacteria such as species of *Vibrio*. EMS can cause up to 100% shrimp mortality and result in a 70% drop in total shrimp production. This bacteria-caused disease has led to the conclusion that sustainable shrimp aquaculture will depend on the development of bio-secure production systems which need to be improved to ensure growth and disease resistance and facilitate bio-shrimp productivity towards sustainable aquaculture. This research work focused on improving the existing methods of disease prevention by examining the nature of

shrimp pathogen interactions to identify promising applications for shrimp farming such as the use of bio inoculants To successfully use microbial composition in shrimp disease management four different approaches to intensive shrimp aquaculture were compared with regard to the bacterial composition vs biological and operational parameters The results indicate that the total suspended solids TSS and pH are the most important indicating a system's biosecurity i e indicate the stability of parameters in a system Overall this thesis provides baseline information on bacterial ecology intending to establish healthy super intensive shrimp aquaculture with recommendations for best practices As a future outlook a shrimp eco culture system is proposed with a high potential for contributing to responsible aquaculture We propose a rapid beneficial bacteria kit such as for *Ruegeria* sq1 and *Pseudoalteromonas* sq91 bacteria as r matured bacteria using biofloc technology as an alternative approach to controlling shrimp disease outbreaks via bacterial activity management
