Forecasting of the financial market have been an attractive topic to scholars and researchers from various academic fields The financial market is an abstract concept where financial commodities such as stocks bonds and precious metals transactions happen between buyers and sellers In the present scenario of the financial market world especially in the stock market forecasting the trend or the price of stocks using machine learning techniques and artificial neural networks are the most attractive issue to be investigated As Giles explained financial forecasting is an instance of signal processing problem which is difficult because of high noise small sample size non stationary and non linearity The noisy characteristics mean the incomplete information gap between past stock trading price and volume with a future price The stock market is sensitive with the political and macroeconomic environment However these two kinds of information are too complex and unstable to gather The above information that cannot be included in features are considered as noise The sample size of financial data is determined by real world transaction records On one hand a larger sample size refers a longer period of transaction records on the other hand large sample size increases the uncertainty of financial environment during the 2 sample period In this project we use stock data instead of daily data in order to reduce the probability of uncertain noise and relatively increase the sample size within a certain period of time By non stationarity one means that the distribution of stock data is various during time changing Non linearity implies that feature correlation of different individual stocks is various Efficient Market Hypothesis was developed by Burton G Malkiel in 1991 *Quantitative Trading Strategies Using Python* Peng Liu,2023 Build and implement trading strategies using Python This book will introduce you to the fundamental concepts of quantitative trading and shows how to use Python and popular libraries to build trading models and strategies from scratch It covers practical trading strategies coupled with step by step implementations that touch upon a wide range of topics including data analysis and visualization algorithmic trading backtesting risk management optimization and machine learning all coupled with practical examples in Python Part one of Quantitative Trading Strategies with Python covers the fundamentals of trading strategies including an introduction to quantitative trading the electronic market risk and return and forward and futures contracts Part II introduces common trading strategies including trend following momentum trading and evaluation process via backtesting Part III covers more advanced topics including statistical arbitrage using hypothesis testing optimizing trading parameters using Bayesian optimization and generating trading signals using a machine learning approach Whether you re an experienced trader looking to automate your trading strategies or a beginner interested in learning quantitative trading this book will be a valuable resource Written in a clear and concise style that makes complex topics easy to understand and chock full of examples and exercises to help reinforce the key concepts you ll come away from it with a firm understanding of core trading strategies and how to use Python to implement them You will Master the fundamental concepts of quantitative trading Use Python and its popular libraries to build trading models and strategies from scratch Perform data analysis and visualization algorithmic trading backtesting risk management optimization and machine learning
