Applied Macroeconometrics Carlo A. Favero,2001-01-11 This text provides graduate students of macroeconomics econometrics and monetary economics with discussion and practical illustrations of the techniques used in applied macroeconometrics Until the 1970s there was consensus regarding both the theoretical foundations and the empirical specification of applied macroeconomic modelling commonly known as the Cowles Commission approach This is no longer the case the Cowles Commission approach broke down in the 1970s to be replaced by a number of prominent competing methods the LSE London School of Economics approach the VAR approach and the intertemporal optimization Real Business Cycle approach Applied Macroeconometrics examines the empirical research strategy of these alternatives by interpreting them as attempts to solve the problems observed in the Cowles Commission approach The different research strategies are illustrated with specific reference to real world examples particularly with respect to the monetary transmission mechanism A common US dataset is used in these examples thus allowing the reader easy comparisons The presentation is based on the view that identification a central concept in econometrics provides a natural framework in which to discuss the alternative strategies currently dominating research The first part of the book introduces time series models and details the importance of their identification The second part illustrates chapter by chapter the alternative approaches providing detailed applications of each methodology Data used in the applications are available in a variety of formats from the author s web site and will be supplemented by exercises for the reader to perform

Foreign Direct Investment as a Tool for Poverty Reduction in Developing Countries Ronald K.S.

Wakyereza,2019-10-15 The textbook experience of poverty can be witnessed in a number of developing countries in Sub Saharan Africa South East Asia and Latin America Accordingly Foreign Direct Investment FDI has been identified as an important tool for poverty reduction as it is noted to accelerate economic growth and employment in a nation and is currently an essential issue for countries such as Uganda This book finds that Ragnar s 1953 Vicious Circle of Poverty remains undisputed even today showing that attracting FDI is not the end but that a nation s absorption capacity is equally paramount The implications of the FDI frog leap theory for developing countries and the Community Capital Absorption Capacity Development CCACD framework provide plausible poverty reduction approaches in the 21st century Without such

measures bringing an end to poverty is likely to elude governments and multinational corporations in developing countries

Signal Extraction Marc Wildi, 2005-09-06 The material contained in this book originated in interrogations about modern practice in time series analysis Why do we use models optimized with respect to one step ahead forecasting performances for applications involving multi step ahead forecasts Why do we infer long term properties unit roots of an unknown process from statistics essentially based on short term one step ahead forecasting performances of particular time series models Are we able to detect turning points of trend components earlier than with traditional signal extraction procedures The link between signal extraction and the first two questions above is not immediate at first sight Signal extraction problems are often solved by suitably designed symmetric filters Towards the boundaries $t = 1$ or $t = N$ of a time series a particular symmetric filter must be approximated by asymmetric filters The time series literature proposes an intuitively straightforward solution for solving this problem Stretch the observed time series by forecasts generated by a model Apply the symmetric filter to the extended time series This approach is called model based Obviously the forecast horizon grows with the length of the symmetric filter Model identification and estimation of unknown parameters are then related to the above first two questions One may further ask if this approximation problem and the way it is solved by model based approaches are important topics for practical purposes Consider some prominent estimation problems The determination of the seasonally adjusted actual unemployment rate

Statistical and Econometric Methods for Transportation Data Analysis Simon Washington, Matthew G. Karlaftis, Fred Mannering, Panagiotis Anastasopoulos, 2020-01-30 The book's website with databases and other support materials can be accessed here Praise for the Second Edition The second edition introduces an especially broad set of statistical methods As a lecturer in both transportation and marketing research I find this book an excellent textbook for advanced undergraduate Master's and Ph D students covering topics from simple descriptive statistics to complex Bayesian models It is one of the few books that cover an extensive set of statistical methods needed for data analysis in transportation The book offers a wealth of examples from the transportation field The American Statistician *Statistical and Econometric Methods for Transportation Data Analysis* Third Edition offers an expansion over the first and second editions in response to the recent methodological advancements in the fields of econometrics and statistics and to provide an increasing range of examples and corresponding data sets It describes and illustrates some of the statistical and econometric tools commonly used in transportation data analysis It provides a wide breadth of examples and case studies covering applications in various aspects of transportation planning engineering safety and economics Ample analytical rigor is provided in each chapter so that fundamental concepts and principles are clear and numerous references are provided for those seeking additional technical details and applications New to the Third Edition Updated references and improved examples throughout New sections on random parameters linear regression and ordered probability models including the hierarchical ordered probit model A new section on random parameters models with heterogeneity in the means and variances of parameter estimates

Multiple new sections on correlated random parameters and correlated grouped random parameters in probit logit and hazard based models A new section discussing the practical aspects of random parameters model estimation A new chapter on Latent Class Models A new chapter on Bivariate and Multivariate Dependent Variable Models Statistical and Econometric Methods for Transportation Data Analysis Third Edition can serve as a textbook for advanced undergraduate Masters and Ph D students in transportation related disciplines including engineering economics urban and regional planning and sociology The book also serves as a technical reference for researchers and practitioners wishing to examine and understand a broad range of statistical and econometric tools required to study transportation problems

Mathematical Theory of Reliability of Time Dependent Systems with Practical Applications Igor N. Kovalenko, Philip A. Pegg, 1997-07-16 One of the greatest problems in engineering is reliability The performance of all machinery degrades over time and unless counteraction is taken at some point any system will eventually fail Once a system fails there are a number of possible solutions the mathematical and statistical measurement and analysis of these solutions forms the mathematical theory of reliability The aim of the authors is to concentrate on aspects of particular importance in the mathematical theory of reliability of time dependent systems rather than give a general overview Particular emphasis is placed on fault tree analysis Monte Carlo methods and importance measures This book will be of particular interest to applied researchers and engineers working in areas where reliability is crucial Contents Introduction Markov and Semi Markov models as a basis for the mathematical analysis of system reliability methods for investigating homogeneous and non homogeneous point processes event flows fault trees the current state of research theory of redundant systems Monte Carlo methods reliability analysis using perturbation methods stiff processes in reliability analysis variance reduction methods analytical statistical methods for rapid simulation of repairable systems with structure redundancy measures of reliability importance of components index
