Structural Steel Semirigid Connections Theory Design And Software:

Structural Steel Semirigid Connections Ciro Faella, Vincenzo Piluso, Gianvittorio Rizzano, 1999-10-27 Although the semirigidity concept was introduced many years ago steel structures are usually designed by assuming that beam to column joints are either pinned or rigid These assumptions allow a great simplification in structural analysis and design but they neglect the true behavior of joints The economic and structural benefits of semirigid joints are well known and much has been written about their use in braced frames However they are seldom used by designers because most semirigid connections have highly nonlinear behavior so that the analysis and design of frames using them is difficult In fact the design problem becomes more difficult as soon as the true rotational behavior of beam to column joints is accounted for the design problem requires many attempts to achieve a safe and economical solution *Structural Steel Semirigid Connections* provides a comprehensive source of information on the design of semirigid frames up to the complete detailing of beam to column connections and focuses on the prediction of the moment rotation curve of connections This is the first work that contains procedures for predicting the connection plastic rotation supply necessary for performing the local ductility control in nonlinear static and dynamic analyses Extensive numerical examples clarify the practical application of the theoretical background This exhaustive reference and the awareness it provides of the influence of joint rotational behavior on the elastic and inelastic responses of structures will greatly benefit researchers professionals and specification writing bodies devoted to structural steel
