Chemical Week ,2007 Technical Report Series ,2006 Dispersion and Dissolution Kinetics of API Particles in Pharmaceutical Hot Melt Extrusion Wang Zhan,2014 Pharmaceutical Hot Melt Extrusion HME is essentially a special case of polymer compounding The elementary steps involved in traditional plastics melt processing are handling of particulates melting dispersive and distributive mixing devolatilization and stripping and finally pressurization and pumping However for pharmaceutical HME the dissolution of the API Active Pharmaceutical Ingredient is an additional and very important elementary step along with the melting of the polymeric excipient that precedes it and mixing which accelerates the dissolution process A major concern in pharmaceutical HME is the thermal degradation of the API To avoid overexposure of API to heat while ensuring complete dissolution of the API in the production of solid solution the dissolution kinetics of the API must be known This work employs a non dissolving surrogate material in an attempt to deconvolute the phenomena of distribution dispersion and dissolution of the API inside a molten polymeric matrix using a Brabender batch mixer in order to determine the dissolution kinetics of the API

Structural Characterizations of Protein Antigens for The Next-Generation Vaccines Against Anthrax and Plague ,2004 Two recombinant protein antigens called rPA and F1 V are recommended by the U S Army as active pharmaceutical ingredients API for the next generation vaccines to protect the warfighter against aerosolized anthrax and plague Separate candidate vaccines containing purified antigen bound to aluminum hydroxide adjuvant in phosphate buffered saline PBS have been tested at the research level and each has satisfied requirements for advancement to product development These criteria included demonstrations of direct and surrogate efficacy in respective animal disease models preliminary assessment of product safety by testing acute toxicity and API stability demonstration of an in vitro correlate of protection for development as a potency test and proposed baseline methods from which to develop a robust manufacturing process and assays for testing product purity quality strength and stability USAMRIID scientists provided the discovery and concept research in this regard for both candidate vaccines and have been performing ongoing supportive basic research to further the eventual translation of each into a viable product In looking forward one of many U S Food and Drug

Administration FDA requirements for eventual human use of these vaccines is documentation of progressive studies that increase understanding of the chemical and biophysical properties of the API Each of these two protein antigens exhibited unexpected physical features early in research that required further definition This paper summarizes our characterizations of observed heterogeneity within these pure vaccine proteins in primary structure for the rPA antigen and in quaternary structure for the F1 V antigen This work also illustrates the value of extending technology base research beyond the stages of discovery and proof of concept so as to better support the creation of medical biological products that will protect the warfighter against biological threats

Predictive in Vitro Dissolution Tools Emmanuel Scheubel, 2010 Dissolution has emerged as a key method during development of medicines and for quality control of marketed products At the early stage of development dissolution guides the selection of toxicology and first test in man formulations At later stages of development dissolution tests are performed to compare prototype formulations the robustness of the manufacturing process to indicate stability and to assure safe release and reproducibility of the products to the market However despite their wide use in pharmaceutical development several challenges still exist In particular there is a lack of thorough identification and understanding of the critical quality attributes that control dissolution of Active Pharmaceutical Ingredient and Drug Product Dissolution exhibits clearly a higher predictability if it can be extrapolated directly to in vivo behavior The present work focuses on the optimization of the existing and alternative dissolution techniques to lay a foundation for Quality by Design QbD principles In Vitro In Vivo Correlation IVIVC and In Vitro In Vivo Relationship IVIVR The dissolution applied on API and on different formulations types Immediate release and extended release form during the different development phases as well as for generic has been explored Simple and cost effective dissolution methods were shown to be potential surrogate for in vivo performance and serve as well for strong quality control method The future perspectives and central role of dissolution testing are presented and discussed
