Silcox, 2013 The examination of Aquaponics as an urban business model is an analysis of alternative means of producing food in a world facing many sustainability related issues The planet's population has exponentially grown over the last 60 years from roughly 2.5 billion people in 1950 to just over 7.0 billion people today and is expected to reach 9.0 billion people by 2050 It is expected that the people of the Earth will need 50% more food and 30% more clean water in the next 30 years despite over feeding a billion and underfeeding a billion people Beddington 2009 The current Earth has depleted soil mineral and water resources and is running out of inexpensive energy sources Brown 2012 This examination explores the option of using technology coupled with an understanding of natural systems to create a food system that can produce both protein and vegetable produce while limiting water use and eliminating the use of soil and other natural resources The very nature of this system provides answers to some of our urban social ills remediation of depleted environmental resources and a profitable and sustainable means of producing food for the long term The use of recirculating aquaculture systems RAS as a system to grow fish intensively coupled with hydroponics to grow organic produce and serve as the system bio filter also known as Aquaponics is becoming more prevalent This system has the advantage of being located anywhere including regions with little water and on small parcels of land either indoors or outdoors This characteristic serves the unique advantage of allowing this system to be located near or in a city putting its products in close proximity to its market for consumption The ability to grow food intensively on a small amount of land in the market area allows the organization to keep the cost of

marketing and distribution at lower levels than organizations with rural or international locations and distant markets. The system has the advantage of recycling water, limiting the need for additional water and using that water as fertilizer to grow high value products. Wastes can be eliminated or mitigated and turned into value added products that can be sold to a growing market while maintaining a low cost intensive fish and organic produce manufacturing facility. The advantages of this model offer not only the opportunity for a profitable business model but for a model that can be beneficial to the community it serves. Locating food producing businesses within the market they serve has the dual benefit of improving that community's resiliency against increasing food costs brought on by higher environmental failing farm lands and transportation as well as providing economic development benefits to the community. This thesis examined recirculating aquaculture systems coupled with hydroponics to determine their use as a viable business model in an urban context. The method of analysis included a review of available literature, an online survey and phone interviews of organizations that have employed aquaculture and a complete financial analysis of aquaponics as a commercial application. The results demonstrate that the solution is viable from the perspective that it is possible to utilize these systems to grow fish and produce sustainably. However, survey results were limited by the size of the sample and the quality of the data collected. Essentially, the size of the response limited the ability to conclude sustainable economic viability. The financial analysis did demonstrate that these systems can be financially viable if well managed. However, the systems can fail economically if solutions to energy and feed problems are not found. Ultimately, aquaponics will be among the food system solution set. The upside potential of the system from an environmental resource and geographic standpoint demonstrate promise where current systems are still depleting earth resources. Finding sustainable solutions to these problems is an imperative that must be met for the future and aquaponics does solve many of these issues.

**Recirculation Aquaculture Systems**, 2020

Recirculating aquaculture systems (RAS) are land based aquaculture facilities either open air or indoors that minimize water consumption by filtering, adjusting and reusing the water. Compared to traditional pond or open water aquaculture, the water recirculation process in RAS makes it possible to control the culture conditions and collect waste. In addition, land based aquaculture avoids escapes and limits external transmission of diseases and parasites. RAS gives promise of more sustainable food production with healthier fish, lower consumption of fresh water and shorter transport distances as fish can be grown closer to the markets. By controlling the culture conditions, aquaculture production in a RAS facility can be established almost anywhere regardless of local conditions. By moving the production on land, it can also mitigate the scarcity of available space and competition for access to sea areas. For example, Atlantic salmon can be produced in Dubai or Florida while warmwater shrimps can be grown in Northern Europe. On the other hand, a RAS facility tends to be quite expensive. Investment costs are high and the recirculation technology consumes vast amounts of energy and requires to be controlled and managed by a skilled workforce. Furthermore, the technology remains to prove its viability on large scale production, especially concerning saline water.

environments Fish welfare is not necessarily ensured in RAS and several projects have experienced mass mortality due to design errors or technical difficulties of the water recirculation Lastly without the correct management fish grown in RAS can have a muddy or earthy off flavour In a world characterised by growing population and the need for increased food production limited fisheries resources environmental impact of traditional aquaculture production and consumer s demand for locally produced environmentally friendly products there is increasing interest in RAS Several companies based or originating in the EU are leading the way in technological development This study aims to give a better understanding of the sector in the EU its size and potential for growth The study includes a mapping of the sector also putting the technology in perspective and comparing it with traditional farming methods Three case studies seek to assess the impact of the technology on competitiveness the impact on operating costs and the differentiation strategies in sales and marketing
