Advanced Biological Treatment Processes Lawrence K. Wang, Nazih K. Shamma, Yung-Tse Hung, 2010-03-10 The past 30 years have seen the emergence of a growing desire worldwide that positive actions be taken to restore and protect the environment from the degrading effects of all forms of pollution air water soil and noise Because pollution is a direct or indirect consequence of waste the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste However as long as waste continues to exist we can only attempt to abate the subsequent pollution by converting it to a less noxious form Three major questions usually arise when a particular type of pollution has been identified 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved This book is one of the volumes of the Handbook of Environmental Engineering series The principal intention of this series is to help readers formulate answers to the last two questions above The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control However the realization of the ever increasing complexity and interrelated nature of current environmental problems renders it imperative that intelligent planning of pollution abatement systems be undertaken

Activated Carbon for Water and Wastewater Treatment Ferhan Cecen, Özgür Aktas, 2011-09-19 This monograph provides comprehensive coverage of technologies which integrate adsorption and biological processes in water and wastewater treatment The authors provide both an introduction to the topic as well as a detailed discussion of theoretical and practical considerations After a review of the basics involved in the chemistry biology and technology of integrated adsorption and biological removal they discuss the setup of pilot and full scale treatment facilities covering powdered as well as granular activated carbon They elucidate the factors that influence the successful operation of integrated systems Their discussion on integrated systems expands from the effects of environmental to the removal of various pollutants to regeneration of activated carbon and to the analysis of such systems in mathematical terms The authors conclude with a look at future needs for research and development A truly valuable resource for environmental engineers environmental and water chemists as well as professionals working in water and wastewater treatment

Membrane Processing Adnan Y. Tamime, 2013-02-18 In the last two decades there have been significant developments in membrane filtration processes for the dairy and beverage industries The filtration systems can be classified into four main groups reverse osmosis nanofiltration ultrafiltration and microfiltration The primary objective of this book is to assess critically the pool of scientific knowledge available to the dairy and beverages industry as a tool for process and product innovation quality improvement and safety The book is divided into three main parts Part I reviews the principals developments and designs of membrane processes that are mainly used in commercial dairy and beverage applications Part II provides information on the applications of membrane processes in the manufacture of dairy products from on farm concentration of milk as a pre treatment for cheesemaking to fractionation of milk and whey to provide ingredients for food and other applications Part III considers membrane applications during the manufacture of fruit juices beer and cider wine and vinegar These include concentration deacidification and dealcoholisation processes

Membrane Processing Dairy and Beverages Applications is an ideal new reference for dairy and beverage processors involved in the

Biological Treatment Processes Lawrence K. Wang, Norman C. Pereira, 2012-12-06 The past few years have seen the emergence of a growing widespread desire in this country and indeed everywhere that positive actions be taken to restore the quality of our environment and to protect it from the degrading effects of all forms of pollution air noise solid waste and water Since pollution is a direct or indirect consequence of waste if there is no waste there can be no pollution and the seemingly idealistic demand for zero discharge can be construed as a demand for zero waste However as long as there is waste we can only attempt to abate the consequent pollution by converting it to a less noxious form In those instances in which a particular type of pollution has been recognized three major questions usually arise 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved The principal intention of this series of books on environmental engineering is to help the reader formulate useful answers to the second

and third of these questions i e to outline the best currently available engineering solutions and to examine their costs in the light of the real level of benefits afforded The traditional approach of applying tried and true solutions to specific pollution problems has been a major factor contributing to the success of environmental engineering and in large measure has accounted for the establishment of a methodology of pollution control
