Nonlinear Robust H-Infinity PID Controller for the Multivariable System Quadrotor

J. P. Ortiz, *Member, IEEE*, L. I. Minchala, *Member, IEEE* and M. J. Reinoso

Abstract— This paper presents the methodology of design of a nonlinear robust controller for attitude regulation and its implementation in an experimental platform of an unmanned aerial vehicle (UAV) quadrotor. Details on the kinematic and dynamic modeling based on the Euler-Lagrange formalism are provided, as well as the particulars of the design of a nonlinear robust H-infinity PID controller to regulate the rotational moments. The performance and effectiveness of the proposed controller are tested in a simulation and an experimental platform. The performance of the proposed controller is compared with a conventional PID controller by using the integral square error (ISE) as performance parameter. Experimental results help to demonstrate the correct operation of the system for real-time application in the presence of unmodeled dynamics and the uncertainties of the parameters.

Keywords— Nonlinear system, quadrotor, robust control, attitude regulation, UAV

I. INTRODUCCIÓN

LOS sistemas de control para vehículos aéreos no tripulados del tipo quadrotor se han desarrollado con gran rapidez en los últimos años. La necesidad de desarrollar sistemas con mayor autonomía, que puedan realizar maniobras de alta complejidad, que realicen misiones de largo alcance, que operen en entornos de alto riesgo para los seres humanos, sin duda han permitido que este campo este bajo continua investigación y desarrollo [1-3].

En [4] se establece un controlador robusto para despegue, seguimiento de trayectoria y aterrizaje, constituido por un controlador de posición y un controlador de orientación. El controlador de posición usa el método de realimentación estático para obtener la altitud deseada, mientras que el control de orientación utiliza un proporcional-derivativo (PD) con una técnica de compensación robusta. En [5] se propone agregar a la estructura del controlador PD un método robusto de sintonización de parámetros, que permite modificar en línea los parámetros del compensador durante el seguimiento de una trayectoria.

Los estudios realizados en [6] plantean un controlador robusto no lineal H∞ para estabilizar los momentos de rotación y un control basado en el enfoque de *backstepping* para el seguimiento de trayectoria. La referencia [7] *sugiere* un controlador del tipo integral predictivo para resolver el problema de seguimiento de trayectoria. Ambos resultados simulados son robustos ante perturbaciones externas del sistema.

En [8] se propone un controlador tolerante a fallas para planeamiento y re-planeamiento de trayectorias. En [9] se implementan y comparan dos algoritmos de control tolerante a fallas basados en: un regulador lineal cuadrático y un controlador de modelo predictivo, los resultados demuestran un desempeño aceptable de los algoritmos para el control de altura en presencia de pérdidas parciales de la acción de los actuadores.

Diversas investigaciones [10-12] han realizado comparaciones entre varias técnicas de control y también usado diferentes modelos matemáticos del sistema [13-15]. Entre los controladores más usados para resolver los problemas de seguimiento de trayectoria y de regulación están: el control por linealización entrada–salida [16], el control por visión [17], el control adaptivo [18], el control por modos deslizantes [19], el control óptimo *backstepping* [20], el control robusto no lineal adaptivo [21], entre otros.

Este artículo propone un controlador robusto para afrontar el problema de regulación del subsistema de orientación de un quadrotor. El problema se divide en tres etapas: en la primera, se obtienen los modelos matemáticos, cinemático y dinámico. En la segunda etapa se presenta el diseño y la implementación del controlador robusto no lineal H∞ que compensa las fuentes de incertidumbre en el modelo debido a dinámicas no modeladas, errores en la estimación de parámetros, perturbaciones exógenas y ruido. En la tercera etapa se realizan las pruebas de funcionamiento y el análisis de desempeño del controlador en las plataformas de simulación y experimental, usando el ISE como criterio de desempeño y obteniéndose buenos resultados en comparación con un sistema de control clásico PID.

Este documento se organiza como sigue: La sección II presenta el modelado matemático del sistema considerando dinámicas no lineales traslacional y rotacional. La sección III muestra el procedimiento para el diseño del controlador robusto no lineal H∞ del sistema de orientación de la aeronave. La sección IV presenta los detalles de la implementación del controlador, tanto en la plataforma de simulación como en la plataforma experimental. La sección V presenta las conclusiones del trabajo.

II. MODELADO MATEMÁTICO DEL SISTEMA

A. Consideraciones del sistema

Un vehículo aéreo no tripulado (UAV por sus siglas en Inglés) posee la configuración de cuatro motores coplanarios, como se muestra en la Fig. 1. La variación controlada de las velocidades en los motores permite el movimiento del quadrotor. El movimiento del sistema hacia adelante (pitch) se logra disminuyendo y aumentando las velocidades de los motores delantero (F1) y trasero (F3) respectivamente. Un desplazamiento lateral (roll) demanda el mismo procedimiento

Announcements & Index ,1993-11   Extending H-infinity Control to Nonlinear Systems J. William Helton,Matthew R. James,1999-01-01 H infinity control originated from an effort to codify classical control methods where one shapes frequency response functions for linear systems to meet certain objectives H infinity control underwent tremendous development in the 1980s and made considerable strides toward systematizing classical control This book addresses the next major issue of how this extends to nonlinear systems At the core of nonlinear control theory lie two partial differential equations PDEs One is a first order evolution equation called the information state equation which constitutes the dynamics of the controller One can view this equation as a nonlinear dynamical system Much of this volume is concerned with basic properties of this system such as the nature of trajectories stability and most important how it leads to a general solution of the nonlinear H infinity control problem   **International Aerospace Abstracts** ,1997   *H-infinity Control for Nonlinear Descriptor Systems* He-Sheng Wang,Chee-Fai Yung,Fan-Ren Chang,2006-01-18 The authors present a study of the H infinity control problem and related topics for descriptor systems described by a set of nonlinear differential algebraic equations They derive necessary and sufficient conditions for the existence of a controller solving the standard nonlinear H infinity control problem considering both state and output feedback One such condition for the output feedback control problem to be solvable is obtained in terms of Hamilton Jacobi inequalities and a weak coupling condition a parameterization of output feedback controllers solving the problem is also provided All of these results are then specialized to the linear case The derivation of state space formulae for all controllers solving the standard H infinity control problem for descriptor systems is proposed Among other important topics covered are balanced realization reduced order controller design and mixed H2 H infinity control H infinity Control for Nonlinear Descriptor Systems provides a comprehensive introduction and easy access to advanced topics   **Thomas Register of American Manufacturers** ,2002 This basic source for identification of U S manufacturers is arranged by product in a large multi volume set Includes Products services Company profiles and Catalog file   *Physics Briefs* ,1981   **Nonlinear H [infinity] Control** W. C. A. Maas,1996   Design of H [infinity] Stabilizing Controller for a Class of Nonlinear Systems Presented by Their Describing Functions Shahzad Khaligh,1998   H Infinity Control Methods in Control and Robust State Estimation for Nonlinear Systems with Sector Bounded Nonlinearities Hua Ouyang,2011 This thesis uses H infinity symbol control methods to study robust state estimation and Lagrange stabilization of sector bounded nonlinear systems According to different stability notions and nonlinearity configurations this thesis is divided into two parts Part A considers robust state estimation for uncertain stochastic systems with slopebounded nonlinearities satisfying Integral Quadratic Constraints IQC and multipliers are used to exploit the uncertainties and nonlinearities A new approach for constructing a robust state estimator for the nonlinear system is developed Part B studies stability analysis and Lagrange stabilizing controller synthesis for pendulum like systems This part proposes two new versions of a Lagrange stability criterion one is used for stability analysis of pendulum like system with a single nonlinearity

and the other one is used for pendulum like system with multiple nonlinearities As these new Lagrange stability criteria do not require the linear part of the pendulum like system under consideration to be minimal they can be applied to more general pendulum like systems than the previous results in the literature Also a sufficient condition which ensures that a periodic in state nonlinear system is a pendulum like system is established These two results enable Lagrange stabilizing controller synthesis for pendulum like systems with multiple nonlinearities To facilitate Lagrange stabilizing controller synthesis for pendulum like systems some results in standard H infinity symbol control are generalized An extended strict bounded real lemma is developed which only requires the pair of system matrices A B to be stabilizable rather than the Hurwitz property of the system matrix A Also a pseudo H infinity symbol control theory is developed This includes a pseudo strict bounded real lemma which relates a pseudo H infinity symbol condition in which the system matrix A has n 1 eigenvalues with negative real parts and one eigenvalue with positive real part and a frequency domain norm bound condition holds to the existence of a sign indefinite solution to an algebraic Riccati equation These results can handle some system control design problems which the standard H infinity symbol control theory is not applicable This is one of the main contributions of this thesis The Lagrange stabilization problem for pendulum like systems with different version of periodic in state nonlinearities is formulated and solved in term of the solutions to game type Riccati equations These equations can be solved using available software kits In addition some examples with simulations are given to illustrate the efficacy of the proposed methods   H(infinity) Control of Nonlinear Systems: A Class of Controllers ,1993 Abstract The standard state space solutions to the Em control problem for linear time invariant systems are generalized to nonlinear time invariant systems A class of nonlinear controllers are parameterized as nonlinear fractional transformations on contractive stable free nonlinear parameters As in the linear case the E control problem is solved by its reduction to four simpler special state space problems together with a separation argument Another byproduct of this approach is that the sufficient conditions for control problem to be solved are also derived with this machinery The solvability for nonlinear H infinity control problem requires positive definite solutions to two parallel decoupled Hamilton Jacobi inequalities and these two solutions satisfy an additional coupling condition An illustrative example which deals with a passive plant is given at the end   H [infinity] Control of Nonlinear Systems with Sampled Measurement Sadanori Suzuki,1994   **Le guide des familles** ,1889   **H [infinity] Controller Synthesis for Sampled-data Systems and Nonlinear Systems** Qi Yu,1999
