Photosynthesis

How do light-dependent and light-independent reactions provide food for a plant?

Why?

Plants are the original solar panels. Through photosynthesis a plant is able to convert electromagnetic (light) energy into chemical energy. This energy is used not only to keep the plant alive, but also to sustain all creatures that rely on the plant for food and shelter. Plants and photosynthetic algae are also the source of all oxygen on Earth, allowing the inhabitants of Earth to benefit from our most plentiful renewable energy resource.

Model 1 – Chloroplast

1. Consider the organelle illustrated in Model 1.

a. What is the name of this organelle?

Chloroplast

b. Is this organelle more likely to be found in animal cells or plant cells?

Plant cells

2. The structures inside the organelle in Model 1 are called thylakoids. What compound necessary for photosynthesis is contained in the thylakoids?

Chlorophyll

The Leaf: A Platform for Performing Photosynthesis William W. Adams III, Ichiro Terashima, 2018-10-24 The leaf is an organ optimized for capturing sunlight and safely using that energy through the process of photosynthesis to drive the productivity of the plant and through the position of plants as primary producers that of Earth's biosphere It is an exquisite organ composed of multiple tissues each with unique functions working synergistically to 1 deliver water nutrients signals and sometimes energy rich carbon compounds throughout the leaf xylem 2 deliver energy rich carbon molecules and signals within the leaf during its development and then from the leaf to the plant once the leaf has matured phloem 3 regulate exchange of gasses between the leaf and the atmosphere epidermis and stomata 4 modulate the radiation that penetrates into the leaf tissues trichomes the cuticle and its underlying epidermis 5 harvest the energy of visible sunlight to transform water and carbon dioxide into energy rich sugars or sugar alcohols for export to the rest of the plant palisade and spongy mesophyll and 6 store sugars and or starch during the day to feed the plant during the night and or acids during the night to support light driven photosynthesis during the day palisade and spongy mesophyll Various regulatory controls that have been shaped through the evolutionary history of each plant species result in an incredible diversity of leaf form across the plant kingdom Genetic programming is also flexible in allowing acclimatory phenotypic adjustments that optimize leaf functioning in response to a particular set of environmental conditions and biotic influences experienced by the plant Moreover leaves and the primary processes carried out by the leaf respond to changes in their environment and the status of the plant through multiple regulatory networks over time scales ranging from seconds to seasons This book brings together the findings from laboratories at the forefront of research into various aspects of leaf function with particular emphasis on the relationship to photosynthesis

Allen,Elisabeth Gantt,John H. Golbeck,Barry Osmond,2008 These Proceedings of the 14th International Congress on Photosynthesis are a record of the most recent advances and emerging themes in research on light energy conversion in biological systems This volume contains 348 edited and peer reviewed chapters from the 824 registered participants at the meeting in Glasgow UK in July 2007 These contributions range from summary overview presentations of plenary speakers through invited lectures and selected topical presentations to expanded contents of posters from research students and their supervisors All chapters feature novel and on going achievements in understanding photosynthesis In the words of Professor Eva Mari Aro outgoing President of the International Society for Photosynthesis Research Having been taken for granted for centuries research in photosynthesis has now become a matter of utmost importance for the future of planet Earth Major initiatives are underway that will use research into natural and artificial photosynthesis for sustainable energy production These volumes thus provide a glimpse of the future from the molecule to the biosphere as seen by the some of the most active scientists in the world Wheat Leaf Photosynthesis in Connection with Ontogenic Changes in the Photophosphorylation and Photochemical Activity of Isolated Chloroplasts ,1990 **Dynamic model of leaf photosynthesis with acclimation to light and nitrogen** J H M (John) Thornley,1998 A simple model of photosynthesis in a mature C₃ leaf is described based on a non rectangular hyperbola the model allows the high light asymptote of that equation P_{max} to respond dynamically to light and nitrogen This causes the leaf light response equation to acclimate continuously to the current conditions of light and N nutrition which can vary

greatly within a crop canopy and through a growing season with important consequences for gross production Predictions are presented for the dynamics of acclimation acclimated and non acclimated photosynthetic rates are compared and the dependence of leaf properties on light and N availability is explored There is good correspondence of predictions with experimental results at the leaf level The model also provides a mechanism for a down regulation of photosynthesis in response to increased carbon dioxide concentrations whose magnitude will depend on conditions particularly of nitrogen nutrition
