Protein Engineering Protocols Kristian Müller,Katja Arndt,2007-10-26 Protein engineering is a fascinating mixture of molecular biology protein structure analysis computation and biochemistry with the goal of developing useful or valuable proteins Protein Engineering Protocols will consider the two general but not mutually exclusive strategies for protein engineering The first is known as rational design in which the scientist uses detailed knowledge of the structure and function of the protein to make desired changes The second strategy is known as directed evolution In this case random mutagenesis is applied to a protein and selection or screening is used to pick out variants that have the desired qualities By several rounds of mutation and selection this method mimics natural evolution An additional technique known as DNA shuffling mixes and matches pieces of successful variants to produce better results This process mimics recombination that occurs naturally during sexual reproduction The first section of Protein Engineering Protocols describes rational protein design strategies including computational methods the use of non natural amino acids to expand the biological alphabet as well as impressive examples for the generation of proteins with novel characteristics Although procedures for the introduction of mutations have become routine predicting and understanding the

effects of these mutations can be very challenging and requires profound knowledge of the system as well as protein structures in general

Protein Engineering Jeffrey L. Cleland, Charles S. Craik, 1996-02-07 This systematic approach to protein engineering provides a thorough introduction to protein biophysics via chapters dealing with the experimental and theoretical determination of protein structure Separate chapters discuss each of the expression systems c

Protein Engineering and Design of Thermostable Biosensors Yaji Tian, 2007 In addition E coli ribose binding protein ecRBP has been stabilized by rational protein engineering to enhance its suitability as a scaffold protein for use in computational design Several approaches have been exploited to improve the thermostability of ecRBP including the introduction of mutations to decrease the entropy of the unfolded form the replacement of unfavored polar amino acids in the protein core with non polar residues the engineering of disulfide bonds and the incorporation of features from thermophilic RBPs The stabilizing mutations achieved from these approaches were evaluated individually and then combined in a stepwise manner resulting in a variant with a melting temperature 17.5 C higher than ecRBP which can also serve as a stable scaffold protein for biosensor design

Protein Engineering and Design with Non Canonical Amino Acids, 2006 The translation machinery of cells can be exploited for the incorporation of various non canonical amino acids into proteins In this work different fluoro amino and methyl containing Tryptophan and Leucine analogues were incorporated into model proteins by the use of selective pressure incorporation SPI method Such isosteric replacements introduced minimal local geometry changes in indole moieties often at the level of single atomic exchange atomic mutation and normally do not affect 3D structures of substituted proteins but induce significant changes in spectral and folding properties For example mutants of Barstar can be stabilised by incorporation of fluorinated Tryptophan analogues while Tryptophan fluorescence can be abolished by 4 and 7 Fluorotryptophan Proteins substituted by toxic analogues can be specifically intracellularly delivered and after their recycling and the release of an analogue target cells would be directed to apoptosis or necrosis
