ANTENNA BASICS

Every ham needs at least one antenna, and most hams have built one. This chapter, by Chuck Heathman, K4CJH, covers theory and construction of antennas for most radio amateurs. More you'll find simple verticals and dipoles, as well as quad and Yagi projects and other antennas that you can build and use.

The amount of available space should be high on the list of factors to consider when selecting an antenna. There's often less in urban areas where most people live except a compromised antenna for the HF bands because a city lot won't accommodate full-size wire dipoles, end-fed systems or high supporting structures. Other limitations are imposed by the amount of money available for an antenna system (including supporting hardware), the quality of antenna feeds to be worked and local zoning ordinances.

Operation objectives also come into play. Do you want to dedicate yourself to narrow-band CW and SSB? Are you looking for general-purpose operation that will hold about a mid-band QSO during periods of good propagation? Your answers should result in selecting an antenna that will meet your needs. You might want to avoid the biggest and best collection of antennas that space and finance will allow. In a mobile system in the order of the day, there are choices in practical and accept the performance that follows. Practically any radiator would work under some propagation conditions, assuming the radiator is able to accept power and radiate in at least useful angle. Are antennas in a good use if it meets your needs?

In general, the height of the antenna above ground is the most critical factor at the higher end of the HF spectrum, that is, from roughly 1.4 through 30 MHz. This is because the antenna should be close to a conductive dipole, such as ground level, plane or sea, ground and the like, plus high enough to have a low radiation angle. Lower frequency antennas, operating between 2 and 10 MHz, should also be kept well away from conductive objects and as high above ground as possible if you want good performance.

Antenna Polarization

Most HF-band antennas are either vertically or horizontally polarized, although circular polarization is possible, just as it is at VHF and UHF. Polarization is determined by the position of the radiating element or wire with respect to the earth. If the radiator that is parallel to the earth radiates horizontally, while an antenna at a right angle to the earth carries a vertical wire, a vertical wave. If a wire antenna is slanted above earth, it radiates waves that have both a vertical and a horizontal component.
