Optimization of Automotive Engine Calibration for Better Fuel Economy J. E. Auiler, J. D. Zbrozek, P. N. Blumberg, Society of Automotive Engineers, 1977 *Modeling and Optimization for Stationary Base Engine Calibration*
Benjamin Berger, 2012 *Application of Multidisciplinary Design Optimisation to Engine Calibration Optimisation* Xuefei Yin, 2012 **Historia del muy esforza do cavallero el Cid Ruy Diaz Campeador** , **Artificial Intelligence and Data Driven Optimization of Internal Combustion Engines** Jihad Badra, Pinaki Pal, Yuanjiang Pei, Sibendu Som, 2022-01-05

Artificial Intelligence and Data Driven Optimization of Internal Combustion Engines summarizes recent developments in Artificial Intelligence AI Machine Learning ML and data driven optimization and calibration techniques for internal combustion engines The book covers AI ML and data driven methods to optimize fuel formulations and engine combustion systems predict cycle to cycle variations and optimize after treatment systems and experimental engine calibration It contains all the details of the latest optimization techniques along with their application to ICE making it ideal for automotive engineers mechanical engineers OEMs and R D centers involved in engine design Provides AI ML and data driven optimization techniques in combination with Computational Fluid Dynamics CFD to optimize engine combustion systems Features a comprehensive overview of how AI ML techniques are used in conjunction with simulations and experiments Discusses data driven optimization techniques for fuel formulations and vehicle control calibration **Application of Multidisciplinary Design Optimisation Frameworks for Engine Mapping and Calibration** Mohammed R. Kianifar, 2014 **Optimal Test Signal Design and Estimation for Dynamic Powertrain Calibration and Control** Ke Fang, 2012

With the dramatic development of the automotive industry and global economy the motor vehicle has become an indispensable part of daily life Because of the intensive competition vehicle manufacturers are investing a large amount of money and time on research in improving the vehicle performance reducing fuel consumption and meeting the legislative requirement of environmental protection Engine calibration is a fundamental process of determining the vehicle performance in diverse working conditions Control maps are developed in the calibration process which must be conducted across the entire operating region before being implemented in the engine control unit to regulate engine parameters at the different operating points The traditional calibration method is based on steady state pseudo static experiments on the engine The primary challenge for the process is the testing and optimisation time that each increases exponentially with additional calibration parameters and control objectives This thesis presents a basic dynamic black box model based calibration method for multivariable control and the method is applied experimentally on a gasoline turbocharged direct injection GTDI 2.0L virtual engine Firstly the engine is characterized by dynamic models A constrained numerical optimization of fuel consumption is conducted on the models and the optimal data is thus obtained and validated on the virtual system to ensure the accuracy of the models A dynamic optimization is presented in which the entire data sequence is divided into segments

then optimized separately in order to enhance the computational efficiency A dynamic map is identified using the inverse optimal behaviour The map is shown to be capable of providing a minimized fuel consumption and generally meeting the demands of engine torque and air fuel ratio The control performance of this feedforward map is further improved by the addition of a closed loop controller An open loop compensator for torque control and a Smith predictor for air fuel ratio control are designed and shown to solve the issues of practical implementation on production engines A basic pseudo static engine based calibration is generated for comparative purposes and the resulting static map is implemented in order to compare the fuel consumption and torque and air fuel ratio control with that of the proposed dynamic calibration method Methods of optimal test signal design and parameter estimation for polynomial models are particularly detailed and studied in this thesis since polynomial models are frequently used in the process of dynamic calibration and control Because of their ease of implementation the input designs with different objective functions and optimization algorithms are discussed Novel design criteria which lead to an improved parameter estimation and output prediction method are presented and verified using identified models of a 1.6L Zetec engine developed from test data obtained on the Liverpool University Powertrain Laboratory Practical amplitude and rate constraints in engine experiments are considered in the optimization and optimal inputs are further validated to be effective in the black box modelling of the virtual engine An additional experiment of input design for a MIMO model is presented based on a weighted optimization method Besides the prediction error based estimation method a simulation error based estimation method is proposed This novel method is based on an unconstrained numerical optimization and any output fitness criterion can be used as the objective function The effectiveness is also evaluated in a black box engine modelling and parameter estimations with a better output fitness of a simulation model are provided

Statistics for Engine Optimization Simon P. Edwards, Daniel M. Grove, Henry P. Wynn, 2000 In 11 specially commissioned articles engineers and statisticians explain how they collaborate to use statistical techniques to expand the tool kit for designing engines demonstrating especially how statistically designed experiments can make a major contribution to meeting existing and future demands in engine development They discuss modeling techniques response surface methods multi stage models neural networks Bayesian methods optimization emulating computer models genetic algorithms on line optimization and robust engineering design Distributed in the US by ASME Annotation copyrighted by Book News Inc Portland OR

Model Assisted Iterative Calibration of Internal Combustion Engines Anuj Pal, 2021 Recent automotive technological advancements mainly focus on improving fuel economy with satisfactory emission levels leading to a significant increment of engine system complexity especially diesel engines This increases the number of engine control parameters making the engine calibration process challenging and time consuming using the conventional map based approach Note that engine calibration is a crucial step in achieving optimal engine performance with satisfactory emissions and it is an expensive process in general With the advancement and widespread adoption of machine learning methods for control

applications it is now possible to use a black box model with intelligence to efficiently calibrate nonlinear systems without detailed knowledge of system dynamics The surrogate assisted optimization approach is an attractive way to reduce the total computational budget for obtaining optimal solutions This makes it special for its application to practical optimization problems requiring a large number of expensive evaluations The current research work focuses on the problem of performing engine calibration using the surrogate assisted optimization approach The objective is to find the trade off curve between engine efficiency in terms of brake specific fuel consumption BSFC and its NOx emissions by efficiently optimizing various control parameters The complete study is divided into three parts The first part deals with modifying the original algorithm for efficiently handling the practical system with measurement noise A new constrained handling algorithm is proposed for lower confidence bound LCB criteria that showed good performance for both deterministic and stochastic systems Furthermore two extensions based on the expected improvement EI criterion are proposed for handling stochastic multi objective problems After the methodology development for handling stochastic systems the second part validates their efficacy for performing the engine calibration in a simulation setting All three algorithms are compared to identify the best approach for its implementation on the actual engine experimental setup Three control parameters namely variable geometry turbocharger VGT vane position exhaust gas recirculating EGR valve position and the start of injection SOI are calibrated to obtain the trade off between engine fuel efficiency performance BSFC and NOx emissions within the constrained design space The simulation study identifies the lower confidence bound LCB criteria with the proposed constraint handling approach to work well in the stochastic setting compared with the other two extensions Therefore this approach is used for the experimental evaluation of the proposed surrogate assisted optimization for engine calibration Finally the third part is the experimental validation It is the first step towards automating the entire engine calibration process Experimental evaluations are performed on a 6.7L Ford diesel engine to validate the algorithm's efficacy Problems with different complexity are formulated and evaluated using the proposed approach Initially a simpler problem with two control variables is formulated to get the confidence to perform the experiments using the proposed algorithm Two variables EGR valve position and VGT vane positions are calibrated to obtain a trade off between engine efficiency BSFC and NOx emissions After observing promising results the study is concluded with a more complicated three control variable problem An external electrically assisted boosting device eBoost is added to the engine system to perform calibration Results showed improved engine performance using the eBoost with a significant reduction in calibration effort in terms of the number of experimental evaluations The study successfully demonstrated the application of the surrogate assisted optimization approach to a practical engine system and opened the door to automate the engine calibration process with reduced calibration efforts
