Adaptive Filtering And Change Detection:

Adaptive Filtering and Change Detection Fredrik Gustafsson,2000-10-03 Adaptive filtering is a branch of digital signal processing which enables the selective enhancement of desired elements of a signal and the reduction of undesired elements Change detection is another kind of adaptive filtering for non stationary signals and is the basic tool in fault detection and diagnosis This text takes the unique approach that change detection is a natural extension of adaptive filtering and the broad coverage encompasses both the mathematical tools needed for adaptive filtering and change detection and the applications of the technology Real engineering applications covered include aircraft automotive communication systems signal processing and automatic control problems The unique integration of both theory and practical applications makes this book a valuable resource combining information otherwise only available in separate sources Comprehensive coverage includes many examples and case studies to illustrate the ideas and show what can be achieved Uniquely integrates applications to airborne automotive and communications systems with the essential mathematical tools Accompanying Matlab toolbox available on the web illustrating the main ideas and enabling the reader to do simulations using all the figures and numerical examples featured This text would prove to be an essential reference for postgraduates and researchers studying digital signal processing as well as practising digital signal processing engineers

Signal and Image Processing for Remote Sensing C.H. Chen,2006-10-09 Most data from satellites are in image form thus most books in the remote sensing field deal exclusively with image processing However signal processing can contribute significantly in extracting information from the remotely sensed waveforms or time series data Pioneering the combination of the two processes Signal and Image Processing for Remote Sensing C.H. Fault Detection, Supervision and Safety of Technical Processes 2006
Hong-Yue Zhang,2007-03-01 The safe and reliable operation of technical systems is of great significance for the protection of human life and health the environment and of the vested economic value The correct functioning of those systems has a profound impact also on production cost and product quality The early detection of faults is critical in avoiding performance degradation and damage to the machinery or human life Accurate diagnosis then helps to make the right decisions on emergency actions and repairs Fault detection and diagnosis FDD has developed into a major area of research at the intersection of systems and control engineering artificial intelligence applied mathematics and statistics and such application fields as chemical electrical mechanical and aerospace engineering IFAC has recognized the significance of FDD by launching a triennial symposium series dedicated to the subject The SAFEPROCESS Symposium is organized every three years since the first symposium held in Baden Baden in 1991 SAFEPROCESS 2006 the 6th IFAC Symposium on Fault Detection Supervision and Safety of Technical Processes was held in Beijing PR China The program included three plenary papers two semi plenary papers two industrial talks by internationally recognized experts and 258 regular papers which have been selected out of a total of 387 regular and invited papers submitted Discusses the developments and future challenges in all aspects of fault diagnosis and fault tolerant control 8 invited and 36 contributed sessions included with a special session on the demonstration of process monitoring and diagnostic software tools

Remote Sensing from Space Bhupendra Jasani,Martino Pesaresi,Stefan Schneiderbauer,Gunter Zeug,2009-09-17 David Stevens Space based information which includes earth observation data is increasingly becoming an integral part of our lives We have been relying for decades on data obtained from meteorological satellites for updates on the weather and to monitor weather related natural disasters such as hurricanes We now count on our personal satellite based navigation systems to guide us to the nearest Starbucks Coffee and use web based applications such as Google Earth and Microsoft Virtual Earth to study the area of places we will or would like to visit At the same time satellite based technologies have experienced impressive growth in recent years with an increase in the number of available sensors an increase in spatial temporal and spectral resolutions an increase in the availability of radar satellites such as Terrasar X and ALOS and the launching of specific constellations such as the Disaster Monitoring Constellation DMC COSMO SkyMed Constellation of small Satellites for the Mediterranean basin Observation and RapidEye Even more recent are the initiatives being set up to ensure that space based information is being accessed and used by decision makers such as Sentinel Asia for the Asia and Pacific region and SERVIR for the Latin America and Caribbean region

Principles of Signal Detection and Parameter Estimation Bernard C. Levy,2008-12-16 Asadiscipline

signal detection has evolved significantly over the last 40 years. Some changes have been caused by technical advances like the development of robust detection methods or the use of the theory of large deviations to characterize the asymptotic performance of tests but most changes have been caused by transformations in the engineering systems to which detection techniques are applied. While early applications of signal detection focused on radar and sonar signal processing or the design of digital communication receivers, newer areas of application include image analysis and interpretation, document authentication, biometrics, and sensor or actuator failure detection. This expanded scope of application has required some adjustment in standard ways of formulating detection problems. For example, image processing applications typically combine parameter estimation and detection tasks so the separation of parameter estimation and detection in distinct operations typical of early communication systems where parameter estimation was accomplished through the use of training signals needs to be abandoned. Other changes have occurred in the design of communication systems which make it increasingly difficult to treat the detection of communications signals and of radar/sonar signals in a unified manner. This common framework assumes implicitly that intersymbol interference is not present and that channel coding and modulation are implemented separately since in this case modulated signals can be detected one symbol at a time. But modern communication systems are typically designed to operate over bandlimited channels where intersymbol interference is present and starting with the introduction of trellis-coded modulation, modulation and coding have become intertwined.

New Directions for Operations Research in Manufacturing Günter Fandel, Thomas Gullledge, Albert Jones, 2012-12-06. Basically five problem areas are addressed by operations research specialists in the manufacturing domain: theoretical and practical aspects in production planning, facility layout, inventory control, tool management, and scheduling. Some of these problems can be solved off-line while others must be treated as real-time problems impacted by the changing state of the system. Additionally, all of these problems have to be dealt with in an integrated systems framework. Several new topics have recently appeared in the scientific literature which now attract the interest of operations researchers. These include distributed real-time scheduling, hierarchical and heterarchical control systems, integrated algorithms for design, process planning, and equipment-level programming, material handling in a finite capacity resource environment, and designing and implementing distributed data management systems. The contributions of these proceedings represent new and unique theoretical developments and applications related to these new topics. They deal with modelling production structures and applying expert systems or neural networks to production systems. Mathematical programming, control theory, simulation, genetic algorithms, tabu search, and simulated annealing are applied as solution techniques.
