

One of nature's most spectacular shows is the aurora borealis. Its lights dance against the dark night sky with rainbows of greens, reds, and yellows pivoting and shifting high above the earth.

The aurora borealis, also known as the northern lights, is a light show that occurs in the northern hemisphere's Arctic region. The further north you go toward the Earth's North Pole, the more likely you are to see the northern lights.

The northern lights work similar to the neon business signs we see in store windows. There is neon gas inside the tubes of the sign. The atoms of the neon gas are excited with electricity. The colors come from this reaction to electricity. The northern lights work in a similar manner, just on a bigger scale.

The northern lights occur because electrically charged particles collide with the Earth's gas atmosphere. On the surface of the Sun, large storms occur and particles are shed. Blown away from the Sun by the solar wind, these particles travel over 90 million miles before they reach Earth. Throughout history, the colors of the lights were a mystery. Stories from the past told tales of spirits and fires in the sky. Scientists, however, tell us that the color of the lights depends on the types of particles that are crashing together and how high the particles are in the atmosphere. The most common color is yellow/green colored lights. This is a result of oxygen high in the Earth's atmosphere and particles from the Sun colliding. When these particles from the Sun collide with nitrogen, the reaction gives off blue or red colors. Sometimes you might see a little pink color, and during strong solar storms you might see red, purple, or white.

People travel from all over the world to see the light show, and the best place to view this wonder of nature in the northern hemisphere is far north. Generally the high northern latitudes and places that border the Arctic Ocean like Alaska, Western Canada, Scandinavia, Russia, Greenland and Iceland are good places to see the lights. In order to see the northern lights you need a clear, dark sky; the farther away from any light sources, the better the viewing of the lights will be. Full moons can inhibit the viewing of the northern lights so a dark moon or no moon is best. Sometime during the winter months is usually a good time to view the lights because the Sun is up too long in the summer to provide good viewing. Forecasters can sometimes predict when the northern lights will be active and visible by monitoring the activity of the Sun.

The light activity peaks every 11 years. It is believed these peaks correspond to high solar activity. The northern lights viewed on August 28 and September 2, 1859, were thought to be the most spectacular in relatively recent history. The lights could be seen throughout the United States, Europe and Japan. This was a rare occurrence and most viewings are limited to places very close to the Arctic Circle.
