Laser Beam Mode Selection by Computer Generated Holograms Victor A. Soifer, Mikhail A. Golub, 1994-07-20 Laser Beam Mode Selection by Computer Generated Holograms brings attention to a new class of optical elements called modans with applications in laser and fiber optics Separation of the transverse modes by modans is discussed in close analogy to well known effects of color separation by diffraction gratings The book describes the basic questions of digital holography in the recording of complex wavefronts on phase only media binary coding cells multilevel computer generated holograms quantization and sampling image reconstruction and computer generation of multifocal and multibeam holograms This collective effort summarizes 12 years of scientific activities in the development of diffractive optical elements and provides considerable material never before published An interesting appendix dedicates itself to mathematical proof of optimal properties of orthogonal base functions and eigenfunctions

Lee,1992 An important feature of computer generated holograms CGHs is to create wavefronts that may be defined only mathematically Since A W Lohmann and his colleagues invented CGHs in 1966 for spatial filtering in image processing the applications of CGHs have multiplied to include 3 D display optical testing diffractive binary optics bifocal intraocular lenses wavefront transformations for material processing pickup heads for optical disks focal plane array detection coherent laser addition beam steering and optical interconnects for parallel computing and neural computing Today the applications of CGHs continue to expand This book features a selection of papers that examine different aspects of the development of CGHs from the 1960s through 1990 because there is no substitute for reading the original papers on any subject even if that subject is mature enough to have many single aspect monographs and textbooks It is hoped that this selection of papers will be valuable additions to many working libraries on this expanding expansive subject

Narayanamurthy,2022-12-16 This book is unique in covering most of the developments on optical holographic techniques since holography s invention in 1947 by Dennis Gabor Starting from conventional holography with photopolymer recording techniques to CCD Charge Coupled Device based digital holography this book covers the spectrum of contemporary holographic techniques The first chapter deals with conventional holographic methods using photographic plates in both in line Gabor holography and off axis holography Then the second chapter covers principle and experimental techniques of the Conoscopic holography technique and the third chapter deals with Computer generated holography The fourth chapter discusses basic principles of dynamic holography using photorefractive crystals where the theory and

experiments show how the photorefractive effect is used for dynamic recording of holograms The fifth and sixth chapters extensively discuss the fundamentals of digital holography and unconventional coherence holography In digital holography two types of phase shifting methods which are dynamic and geometric phase shifting digital holographic techniques are elaborated with practical examples Then in the sixth chapter the unconventional coherence holographic method describes a new holography using incoherent light sources This book is intended for advanced undergraduate and first year graduate level students as well as researchers looking for a complete resource in holography techniques     **Optics Letters** ,2002
