

Mitosis Notes

Cell division occurs in a series of stages, or phases.

1st: INTERPHASE

- Chromosomes are copied (# doubles)
- Chromosomes appear as threadlike coils (chromatin) at the start, but each chromosome and its copy (sister chromosome) change to sister chromatids at end of this phase

2nd: PROPHASE

- Mitosis begins (cell begins to divide)
- Centrioles (or poles) appear and begin to move to opposite ends of cell
- Spindle fibers form between the poles

3rd: METAPHASE

- Chromatids (or pairs of chromosomes) attach to the spindle fibers

4th: ANAPHASE

- Chromatids (or pairs of chromosomes) separate and begin to move to opposite ends of the cell

5th: TELOPHASE

- Two new nuclei form
- Chromosomes appear as chromatin (threads rather than rods)
- Mitosis ends

6th: CYTOKINESIS

- Cell membrane moves inward to create two daughter cells - each with its own nucleus with identical chromosomes
