

Numerical Analysis

Analysis generally implies solving a problem through equations. The equations must be reduced to an answer through procedures of algebra, calculus, differential equations, partial differential equations etc.

Numerical Analysis is essentially analysis using only procedures of arithmetic, i.e. addition, subtraction, multiplication, division and comparison.

Because the operations involved in numerical analysis are exactly what computers can do, numerical analysis and computers are intimately related.

Goals we wish to achieve while using numerical analysis:

1. **Accuracy:** Amount and ability to control error
2. **Efficiency:** Number of steps taken to reach our solution
3. **Stability:** Small Deviations in output corresponding to small deviations in input (otherwise it is unstable)
