ICCWS 2018 13th International Conference on Cyber Warfare and Security Dr. Louise Leenen,2018-03-08 These proceedings represent the work of researchers participating in the 13th International Conference on Cyber Warfare and Security ICCWS 2018 which is being hosted this year by the National Defense University in Washington DC USA on 8 9 March 2018 **Security in Computing and Communications** Sabu M Thampi,Pradeep K. Atrey,Chun I. Fan,Gregorio Martinez Perez,2013-08-15 This book constitutes the refereed proceedings of the International Symposium on Security in Computing and Communications SSCC 2013 held in Mysore India in August 2013 The 24 revised full papers presented together with 15 poster papers were carefully reviewed and selected from 111 submissions The papers cover all aspects of secure computing and communication in networking and distributed systems such as cloud based data centers

Innovations in Computing Sciences and Software Engineering Tarek Sobh,Khaled Elleithy,2010-06-26 Innovations in Computing Sciences and Software Engineering includes a set of rigorously reviewed world class manuscripts addressing and detailing state of the art research projects in the areas of Computer Science Software Engineering Computer Engineering and Systems Engineering and Sciences Topics Covered Image and Pattern Recognition Compression Image processing Signal Processing Architectures Signal Processing for Communication Signal Processing Implementation Speech Compression and Video Coding Architectures Languages and Systems Algorithms Databases Embedded Systems and Applications File Systems and I O Geographical Information Systems Kernel and OS Structures Knowledge Based Systems Modeling and Simulation Object Based Software Engineering Programming Languages and Programming Models and tools Parallel Processing Distributed Scheduling Multiprocessing Real time Systems Simulation Modeling and Development and Web Applications Signal and Image Processing Content Based Video Retrieval Character Recognition Incremental Learning for Speech Recognition Signal Processing Theory and Methods and Vision based Monitoring Systems Software and Systems Activity Based Software Estimation Algorithms Genetic Algorithms Information Systems Security Programming Languages Software Protection Techniques Software Protection Techniques and User Interfaces Distributed Processing Asynchronous Message Passing System Heterogeneous Software Environments Mobile Ad Hoc Networks Resource Allocation and Sensor Networks New trends in computing Computers for People of Special Needs Fuzzy Inference Human Computer Interaction Incremental Learning Internet based Computing Models Machine Intelligence Natural Language Cyberspace Mimic Defense Jiangxing Wu,2019-12-02 This book discusses uncertain threats which are caused by unknown attacks based on unknown vulnerabilities or backdoors in the information system or control devices and software hardware Generalized robustness control architecture and the mimic defense mechanisms are presented in this book which could change the easy to attack and difficult to defend game in cyberspace The endogenous uncertain effects from the targets of the software hardware based on this architecture can produce magic mimic defense fog and suppress in a normalized mode random disturbances

caused by physical or logic elements as well as effects of non probability disturbances brought by uncertain security threats Although progress has been made in the current security defense theories in cyberspace and various types of security technologies have come into being the effectiveness of such theories and technologies often depends on the scale of the prior knowledge of the attackers on the part of the defender and on the acquired real timing and accuracy regarding the attackers behavior features and other information Hence there lacks an efficient active defense means to deal with uncertain security threats from the unknown Even if the bottom line defense technologies such as encrypted verification are adopted the security of hardware software products cannot be quantitatively designed verified or measured Due to the loose coupling relationship and border defense modes between the defender and the protected target there exist insurmountable theoretical and technological challenges in the protection of the defender and the target against the utilization of internal vulnerabilities or backdoors as well as in dealing with attack scenarios based on backdoor activated collaboration from both inside and outside no matter how augmented or accumulated protective measures are adopted Therefore it is urgent to jump out of the stereotyped thinking based on conventional defense theories and technologies find new theories and methods to effectively reduce the utilization of vulnerabilities and backdoors of the targets without relying on the priori knowledge and feature information and to develop new technological means to offset uncertain threats based on unknown vulnerabilities and backdoors from an innovative perspective This book provides a solution both in theory and engineering implementation to the difficult problem of how to avoid the uncontrollability of product security caused by globalized marketing COTS and non trustworthy software hardware sources It has been proved that this revolutionary enabling technology has endowed software hardware products in IT ICT CPS with endogenous security functions and has overturned the attack theories and methods based on hardware software design defects or resident malicious codes This book is designed for educators theoretical and technological researchers in cyber security and autonomous control and for business technicians who are engaged in the research on developing a new generation of software hardware products by using endogenous security enabling technologies and for other product users Postgraduates in IT ICT CPS ICS will discover that as long as the law of structure determines the nature and architecture determines the security is properly used the problem of software hardware design defects or malicious code embedding will become the swelling of Achilles in the process of informationization and will no longer haunt Pandora s box in cyberspace Security and opening up advanced progressiveness and controllability seem to be contradictory but there can be theoretically and technologically unified solutions to the problem

This problem can be especially severe for persistent state making intrusion analysis and recovery a time consuming and error prone process. Since file sharing across applications is relatively uncommon, we propose limiting the effects of attacks and simplifying the post intrusion recovery process through explicit sharing of all persistent data. We present a system, Solitude, that uses a copy on write filesystem for running untrusted applications transparently in a sandboxing environment. Solitude provides two modes of recovery. If a sandboxed application proves to be untrustworthy, a coarse grained recovery method allows completely removing the footprint of the software. However, if untrusted files are mistakenly moved from the sandbox to the regular environment via explicit sharing, then Solitude uses data dependency tracking to allow fine grained recovery.
