Market Risk Analysis, Quantitative Methods in Finance Carol Alexander,2008-04-30 Written by leading market risk academic Professor Carol Alexander Quantitative Methods in Finance forms part one of the Market Risk Analysis four volume set Starting from the basics this book helps readers to take the first step towards becoming a properly qualified financial risk manager and asset manager roles that are currently in huge demand Accessible to intelligent readers with a moderate understanding of mathematics at high school level or to anyone with a university degree in mathematics physics or engineering no prior knowledge of finance is necessary Instead the emphasis is on understanding ideas rather than on mathematical rigour meaning that this book offers a fast track introduction to financial analysis for readers with some quantitative background highlighting those areas of mathematics that are particularly relevant to solving problems in financial risk management and asset management Unique to this book is a focus on both continuous and discrete time finance so that Quantitative Methods in Finance is not only about the application of mathematics to finance it also explains in very pedagogical terms how the continuous time and discrete time finance disciplines meet providing a comprehensive highly accessible guide which will provide readers with the tools to start applying their knowledge immediately All together the Market Risk Analysis four volume set illustrates virtually every concept or formula with a practical numerical example or a longer empirical case study Across all four volumes there are approximately 300 numerical and empirical examples 400 graphs and figures and 30 case studies many of which are contained in interactive Excel spreadsheets available from the accompanying CD ROM Empirical examples and case studies specific to this volume include Principal component analysis of European equity indices Calibration of Student t distribution by maximum likelihood Orthogonal regression and estimation of equity factor models Simulations of geometric Brownian motion and of correlated Student t variables Pricing European and American options with binomial trees and European options with the Black Scholes Merton formula Cubic spline fitting of yields curves and implied volatilities Solution of Markowitz problem with no short sales and other constraints Calculation of risk adjusted performance metrics including generalised Sharpe ratio omega and kappa indices

Market Risk Analysis, Boxset Carol Alexander,2009-02-24 Market

Risk Analysis is the most comprehensive rigorous and detailed resource available on market risk analysis. Written as a series of four interlinked volumes, each title is self-contained, although numerous cross-references to other volumes enable readers to obtain further background knowledge and information about financial applications. Volume I, Quantitative Methods in Finance, covers the essential mathematical and financial background for subsequent volumes. Although many readers will already be familiar with this material, few competing texts contain such a complete and pedagogical exposition of all the basic quantitative concepts required for market risk analysis. There are six comprehensive chapters covering all the calculus, linear algebra, probability, and statistics, numerical methods, and portfolio mathematics that are necessary for market risk analysis. This is an ideal background text for a Masters course in finance. Volume II, Practical Financial Econometrics, provides a detailed understanding of financial econometrics with applications to asset pricing and fund management, as well as to market risk analysis. It covers equity factor models, including a detailed analysis of the Barra model and tracking error, principal component analysis, volatility, and correlation, GARCH, cointegration, copulas, Markov switching, quantile regression, discrete choice models, non-linear regression, forecasting, and model evaluation. Volume III, Pricing, Hedging, and Trading Financial Instruments, has five very long chapters on the pricing, hedging, and trading of bonds and swaps, futures, and forwards, options, and volatility, as well as detailed descriptions of mapping portfolios of these financial instruments to their risk factors. There are numerous examples, all coded in interactive Excel spreadsheets, including many pricing formulae for exotic options, but excluding the calibration of stochastic volatility models, for which Matlab code is provided. The chapters on options and volatility together constitute 50% of the book, the slightly longer chapter on volatility concentrating on the dynamic properties, the two volatility surfaces, the implied and the local volatility surfaces that accompany an option pricing model, with particular reference to hedging. Volume IV, Value at Risk Models, builds on the three previous volumes to provide by far the most comprehensive and detailed treatment of market VaR models that is currently available in any textbook. The exposition starts at an elementary level, but as in all the other volumes, the pedagogical approach, accompanied by numerous interactive Excel spreadsheets, allows readers to experience the application of parametric, linear, historical simulation, and Monte Carlo VaR models to increasingly complex portfolios. Starting with simple positions, after a few chapters, we apply value at risk models to interest rate sensitive portfolios, large international securities portfolios, commodity futures, path dependent options, and much else. This rigorous treatment includes many new results and applications to regulatory and economic capital allocation, measurement of VaR model risk, and stress testing.

Journal of the American Statistical Association, 2007. A scientific and educational journal, not only for professional statisticians, but also for economists, business executives, research directors, government officials, university professors, and others who are seriously interested in the application of statistical methods to practical problems, in the development of more useful methods, and in the improvement of basic statistical data.
