Collectors Arthur V. Killian, 2009 A solar collector is a device for extracting the energy of the sun directly into a more usable or storable form The energy in sunlight is in the form of electromagnetic radiation from the infrared long to the ultraviolet short wavelengths The solar energy striking the earth's surface at any one time depends on weather conditions as well as location and orientation of the surface but overall it averages about 1000 watts per square meter on a clear day with the surface directly perpendicular to the sun's rays Solar collectors are the key component of active solar heating systems Solar collectors gather the sun's energy transform its radiation into heat then transfer that heat to water solar fluid or air The solar thermal energy can be used in solar water heating systems solar pool heaters and solar space heating systems There are several types of solar collectors Flat plate collectors Evacuated tube collectors and Integral collector storage systems

Collectors, 1997 **Solar Collectors** Martín Picón-Núñez, 2018 This book is intended to provide an engineering point of view and the design tools for low temperature solar collectors as well as their networks in large solar installations for the integration of solar energy in processing industries To this end the book covers the description of existing solar technology performance enhancement techniques for single units hydrodynamics and its influence on flow distribution inside tubes its effect upon thermal efficiency and pressure drop profiles A detailed graphical description of the thermo hydraulic behavior using experimentally validated Computational Fluid Dynamics simulations are described An important contribution is the introduction of the main concepts to design and specify the structure of solar collector networks based on the reconciliation of the thermal and hydraulic lengths The thermal performance is analyzed as a function of the velocity of the fluid and its relation to the rate of heat transfer Likewise velocity is analyzed in connection to the pressure drop This approach allows the engineer to determine the structure of a solar collector network which is defined by two parameters the number of parallel sets of collectors and the number of collectors per set to achieve the process thermal needs at the specified temperature within the limitations of the pressure drop These tools are put forward within the frame of flexible plant operation Nova
