Field Solutions on Computers Stanley Humphries, Jr., 2020-09-23 *Field Solutions on Computers* covers a broad range of practical applications involving electric and magnetic fields. The text emphasizes finite element techniques to solve real world problems in research and industry. After introducing numerical methods with a thorough treatment of electrostatics, the book moves in a structured sequence to advanced topics. These include magnetostatics with non linear materials, permanent magnet devices, RF heating, eddy current analysis, electromagnetic pulses, microwave structures and wave scattering. The mathematical derivations are supplemented with chapter exercises and comprehensive reviews of the underlying physics. The book also covers essential supporting techniques such as mesh generation, interpolation, sparse matrix inversions and advanced plotting routines.

Antenna Theory Constantine A. Balanis, 2016-02-01 Updated with color and gray scale illustrations, a companion website housing supplementary material and new sections covering recent developments in antenna analysis and design. This book introduces the fundamental principles of antenna theory and explains how to apply them to the analysis, design and measurements of antennas. Due to the variety of methods of analysis and design and the different antenna structures available, the applications covered in this book are made to some of the most basic and practical antenna configurations. Among these antenna configurations are linear dipoles, loops, arrays, broadband antennas, aperture antennas, horns, microstrip antennas and reflector antennas. The text contains sufficient mathematical detail to enable undergraduate and beginning graduate students in electrical engineering and physics to follow the flow of analysis and design. Readers should have a basic knowledge of undergraduate electromagnetic theory including Maxwell's equations and the wave equation, introductory physics and differential and integral calculus. Presents new sections on flexible and conformal, bowtie, Vivaldi antenna, antenna miniaturization, antennas for mobile communications, dielectric resonator antennas and scale modeling. Provides color and gray scale figures and illustrations to better depict antenna radiation characteristics. Includes access to a companion website housing MATLAB programs, Java based applets and animations, Power Point notes, Java based interactive questionnaires and a solutions manual for instructors. Introduces over 100 additional end of chapter problems.

Antenna Theory: Analysis and Design Fourth Edition is designed to meet the needs of senior undergraduate and beginning graduate level students in electrical engineering and physics as well as practicing engineers and antenna designers. Constantine A. Balanis received his BSEE degree from the Virginia Tech in 1964, his MEE degree from the University of Virginia in 1966, his PhD in Electrical Engineering from The Ohio State University in 1969 and an Honorary Doctorate from the Aristotle University of Thessaloniki in 2004. From 1964 to 1970 he was with the NASA Langley Research Center in Hampton VA and from 1970 to 1983 he was with the Department of Electrical Engineering of West Virginia University. In 1983 he joined Arizona State University and is now Regents Professor of Electrical Engineering. Dr. Balanis is also a life fellow of the IEEE.

Cheng,1983 *A Synthesized Electrooptic Directional-coupler Modulator at 1300-nanometer Wavelength with Low Switching Voltage* Chanin Laliew,2002 A low switching voltage electrooptic directional coupler modulator for use in analog optical communication systems at the wavelength of 1300 nanometers was investigated Conventional optical directional couplers have a pair of their constitutive waveguides running in parallel and thus the coupling between them is constant throughout the length of the structure and this gives rise to an approximate sinc squared amplitude transfer function This transfer or response function is nonlinear and therefore modulators based on the constant coupling directional coupler may only have a small modulation depth of about 2% 5% for analog communication systems In this work the directional coupler was modified by varying the etch depth between the two constitutive waveguides while keeping the spacing between them constant along the length of the structure so that the modulator s response function of the desired form was obtained and exhibited high linearity Consequently large dynamic range and low switching voltage operation may be realized with this directional coupler modulator Based on this concept the device built in AlGaAs GaAs semiconductor material was designed fabricated and tested The do experimental result shows that the directional coupler modulator which is 1.5 cm long has a switching voltage of about 1.8 volts one of the lowest values for electrooptic modulators built to date With further investigation on the RF microwave characteristics the directional coupler modulator based on this design might prove to be promising for use in the optical communication mainstream
