Motion in Games Arjan Egges,Roland Geraerts,Mark Overmars,2009-11-16 Following the very successful Motion in Games event in June 2008 we organized the Second International Workshop on Motion in Games MIG during November 21 24 2009 in Zeist The Netherlands Games have become a very important medium for both education and tertainment Motion plays a crucial role in computer games Characters move around objects are manipulated or move due to physical constraints entities are animated and the camera moves through the scene Even the motion of the player nowadays is used as input to games Motion is currently studied in many di erent areas of research including graphics and animation game technology robotics simulation computer vision and also physics psychology and urban studies Cross

fertilization between these communities can considerably advance the state of the art in this area. The goal of the workshop Motion in Games is to bring together researchers from this variety of fields to present the most recent results and to initiate collaboration. The workshop is organized by the Dutch research project GATE. In total the workshop this year consisted of 27 high quality presentations by a selection of internationally renowned speakers in the field of games and simulations. We were extremely pleased with the quality of the contributions to the MIG workshop and we look forward to organizing a follow up MIG event.

Numerical Methods for Linear Complementarity Problems in Physics-Based Animation Sarah Niebe, Kenny Erleben, 2015-01-01. Linear complementarity problems (LCPs) have for many years been used in physics based animation to model contact forces between rigid bodies in contact. More recently LCPs have found their way into the realm of fluid dynamics. Here LCPs are used to model boundary conditions with fluid wall contacts. LCPs have also started to appear in deformable models and granular simulations. There is an increasing need for numerical methods to solve the resulting LCPs with all these new applications. This book provides a numerical foundation for such methods especially suited for use in computer graphics. This book is mainly intended for a researcher, Ph.D. student, post doc, professor who wants to study the algorithms and do more work research in this area. Programmers might have to invest some time brushing up on math skills for this we refer to Appendices A and B. The reader should be familiar with linear algebra and differential calculus. We provide pseudo code for all the numerical methods which should be comprehensible by any computer scientist with rudimentary programming skills. The reader can find an online supplementary code repository containing Matlab implementations of many of the core methods covered in these notes as well as a few Python implementations. Erleben 2011
