

Motion in One Dimension

Rest and Motion

- A body is said to be at rest if its position with respect to its surrounding does not change.
- A body is said to be in motion if its position changes with respect to its surroundings.
- **One dimensional motion:** When a body moves along a straight line path, its motion is said to be one dimensional motion. It is also called motion in a straight line or rectilinear motion.
- **Representation of one dimensional motion:** The path of straight line motion is represented by a straight line parallel to the x-axis.

Distance and Displacement

- The total length of the path travelled by a body is called the **distance** travelled by that body. This path may or may not be straight.
It is a scalar quantity and is represented by S . Its SI unit is metre (m).
- The shortest distance from the initial to the final position of the body is called magnitude of displacement. Its direction is from the initial to the final position.

It is a vector quantity and is represented by \vec{S} . Its SI unit is also metre (m).

- **Distinction between distance and displacement**

Distance	Displacement
It is the length of path travelled by an object in a certain time.	It is the shortest distance between the initial and final positions.
It is a scalar.	It is a vector.
It depends on the path followed by the object.	It is independent of the path of the object.
It can be more than or equal to the magnitude of displacement.	Its magnitude can be less than or equal to the distance.

Speed

- Speed is defined as 'the distance travelled by an object per unit time' or 'the rate of change of distance with time'.

$$\text{Speed}(v) = \frac{\text{Distance}(S)}{\text{time}(t)}$$

- The SI unit of speed is **metre per second** and is written as m s^{-1} .
- It is a scalar quantity.
