critical In particular there is a need to characterize the ecological infrastructures processes and ecosystem functions that underpin the ecosystem services in ways that can be evaluated and tracked Potschin and Haines Young 2016 In addition various intervention measures to restore degraded ecosystems require constant and accurate measurement of the ecosystem characteristics in order to assess the benefits of ecological restoration Vegetation in particular provides a number of provisioning forage production food regulatory climate temperature supporting primary production nutrient cycling and cultural educational recreation ecosystem services as well as biodiversity maintenance Masenyama et al 2022 Remote sensing data contributes significantly to mapping modeling and quantitative valuation of the ecosystem services in a spatially explicit manner It provides an opportunity to use standard protocols at various spatial scales as well as wall to wall mapping of phenomena through time which is critical for monitoring on a continuous basis
