Multidimensional Signal and Color Image Processing Using Lattices Eric Dubois,2019-03-12 An Innovative Approach to Multidimensional Signals and Systems Theory for Image and Video Processing In this volume Eric Dubois further develops the theory of multi D signal processing wherein input and output are vector value signals With this framework he introduces the reader to crucial concepts in signal processing such as continuous and discrete domain signals and systems discrete domain periodic signals sampling and reconstruction light and color random field models image representation and more While most treatments use normalized representations for non rectangular sampling this approach obscures much of the geometrical and scale information of the signal In contrast Dr Dubois uses actual units of space time and frequency Basis independent representations appear as much as possible and the basis is introduced where needed to perform calculations or implementations Thus lattice theory is developed from the beginning and rectangular sampling is treated as a special case This is especially significant in the treatment of color and color image processing and for discrete transform representations based on symmetry groups including fast computational algorithms Other features include An entire chapter on lattices giving the reader a thorough grounding in the use of lattices in signal processing Extensive treatment of lattices as used to describe discrete domain signals and signal periodicities Chapters on sampling and reconstruction random field models symmetry invariant signals and systems and multidimensional Fourier transformation properties Supplemented throughout with MATLAB examples and accompanying downloadable source code Graduate and doctoral students as well as senior undergraduates and professionals working in signal processing or video image processing and imaging will appreciate this
