Mathematical Modelling and Computing in Physics, Chemistry and Biology Zdzislaw Trzaska, 2023-12-22 This book keeps an eye in the direction of applications of advanced and high performance scientific computing in describing the behavior of natural and constructed systems e g chaos bifurcation fractal Lyapunov exponent period doubling Poincar map strange attractor etc With the aid of powerful computers the modern theory of chaos and its geometry the fractals and attractors are developed The concepts of object oriented computing are introduced early in the text and steadily expanded as one progresses through the chapters The beginning of each chapter is of an introductory nature followed by practical applications the discussion of numerical results theoretical investigations on nonlinear stability and convergence This is the first complete introduction to process modelling and computing that fully integrates software tools enabling professionals and students to master critical techniques hands on through computer simulations based on the popular MATLAB environment The book offers a simple tool for all those oscillations that are travelling through the world helping them discover its hidden beauty Many applications as well as results of computer simulations are presented The center of concern is set on existing as well as emerging continuous methods of investigations useful for researchers engineers and practitioners active in many and often interdisciplinary fields where physics electrochemistry biology and medicine play a key role Coverage includes Dynamic behavior of nonlinear systems Fundamental descriptions of processes exhibiting nonlinear oscillations Mechanism and function of structures of nonlinear oscillations patterns Analysis of dynamical oscillations in electric circuits and systems Artificial intelligence models of natural systems Nonlinear oscillations in chemistry biology and medicine Oscillations in mechanics and transport systems Oscillations in fractional order systems Energy harvesting systems from the surrounding environment With an insatiable

appetite for exploring the surrounding world and doing research this book can help readers quickly find ways to use new computers and facilitate the quest for greater knowledge and understanding of reality The reach of novelty of the book ranges from new mathematical ideas to motivating questions and science issues in many subject areas **Math and Bio 2010** Lynn Arthur Steen,2005 Math and bio 2010 grew out of Meeting the Challenges Education across the Biological Mathematical and Computer Sciences a joint project of the Mathematical Association of America MAA the National Science Foundation Division of Undergraduate Education NSF DUE the National Institute of General Medical Sciences NIGMS the American Association for the Advancement of Science AAAS and the American Society for Microbiology ASM Foreword p vi

Cellular Automaton Modeling of Biological Pattern Formation Andreas Deutsch,Sabine Dormann,2007-12-26 This book focuses on a challenging application field of cellular automata pattern formation in biological systems such as the growth of microorganisms dynamics of cellular tissue and tumors and formation of pigment cell patterns These phenomena resulting from complex cellular interactions cannot be deduced solely from experimental analysis but can be more easily examined using mathematical models in particular cellular automaton models While there are various books treating cellular automaton modeling this interdisciplinary work is the first one covering biological applications The book is aimed at researchers practitioners and students in applied mathematics mathematical biology computational physics bioengineering and computer science interested in a cellular automaton approach to biological modeling *Network-Oriented Modeling* Jan Treur,2016-10-03 This book presents a new approach that can be applied to complex integrated individual and social human processes It provides an alternative means of addressing complexity better suited for its purpose than and effectively complementing traditional strategies involving isolation and separation assumptions Network oriented modeling allows high level cognitive affective and social models in the form of cyclic graphs to be constructed which can be automatically transformed into executable simulation models The modeling format used makes it easy to take into account theories and findings about complex cognitive and social processes which often involve dynamics based on interrelating cycles Accordingly it makes it possible to address complex phenomena such as the integration of emotions within cognitive processes of all kinds of internal simulations of the mental processes of others and of social phenomena such as shared understandings and collective actions A variety of sample models including those for ownership of actions fear and dreaming the integration of emotions in joint decision making based on empathic understanding and evolving social networks illustrate the potential of the approach Dedicated software is available to support building models in a conceptual or graphical manner transforming them into an executable format and performing simulation experiments The majority of the material presented has been used and positively evaluated by undergraduate and graduate students and researchers in the cognitive social and AI domains Given its detailed coverage the book is ideally suited as an introduction for graduate and undergraduate students in many different multidisciplinary fields involving cognitive affective social biological and neuroscience domains

Mechanics and Dynamical Systems with Mathematica® Nicola Bellomo, Luigi Preziosi, Antonio Romano, 1999-12-28

Modeling and Applied Mathematics Modeling the behavior of real physical systems by suitable evolution equations is a relevant maybe the fundamental aspect of the interactions between mathematics and applied sciences Modeling is however only the first step toward the mathematical description and simulation of systems belonging to real world Indeed once the evolution equation is proposed one has to deal with mathematical problems and develop suitable simulations to provide the description of the real system according to the model Within this framework one has an evolution equation and the related mathematical problems obtained by adding all necessary conditions for their solution Then a qualitative analysis should be developed this means proof of existence of solutions and analysis of their qualitative behavior Asymptotic analysis may include a detailed description of stability properties Quantitative analysis based upon the application of suitable methods and algorithms for the solution of problems ends up with the simulation that is the representation of the dependent variable versus the independent one The information obtained by the model has to be compared with those deriving from the experimental observation of the real system This comparison may finally lead to the validation of the model followed by its application and maybe further generalization

Low-Power High-Resolution Analog to Digital Converters Amir Zjajo, José Pineda de Gyvez, 2010-10-29 With the fast advancement of CMOS fabrication technology more and more signal processing functions are implemented in the digital domain for a lower cost lower power consumption higher yield and higher reconfigurability This has recently generated a great demand for low power low voltage A/D converters that can be realized in a mainstream deep submicron CMOS technology However the discrepancies between lithography wavelengths and circuit feature sizes are increasing Lower power supply voltages significantly reduce noise margins and increase variations in process device and design parameters Consequently it is steadily more difficult to control the fabrication process precisely enough to maintain uniformity The inherent randomness of materials used in fabrication at nanoscopic scales means that performance will be increasingly variable not only from die to die but also within each individual die Parametric variability will be compounded by degradation in nanoscale integrated circuits resulting in instability of parameters over time eventually leading to the development of faults Process variation cannot be solved by improving manufacturing tolerances variability must be reduced by new device technology or managed by design in order for scaling to continue Similarly within die performance variation also imposes new challenges for test methods In an attempt to address these issues Low Power High Resolution Analog to Digital Converters specifically focus on i improving the power efficiency for the high speed and low spurious spectral A/D conversion performance by exploring the potential of low voltage analog design and calibration techniques respectively and ii development of circuit techniques and algorithms to enhance testing and debugging potential to detect errors dynamically to isolate and confine faults and to recover errors continuously The feasibility of the described methods has been verified by measurements from the silicon prototypes fabricated in standard 180nm 90nm and 65nm

CMOS technology **Calculus** William Bauldry, Wade Ellis, 1999 The first generation of calculus reformers exploited emerging technologies and the theme of multiple representations of functions These pioneers also demonstrated effective innovative teaching techniques including collaborative learning writing discovery and extended problem solving Calculus Mathematics and Modeling introduces a second generation of calculus reform combining the lessons of the first generation with advances in differential equations through the use of discrete dynamical systems This teaching philosophy requires a computational environment in which students can move smoothly between symbolic numeric graphic and textual contexts The text requires use of a computer algebra capable graphing calculator
