International Handbook of Mathematical Learning Difficulties Annemarie Fritz, Vitor Geraldi Haase, Pekka Räsänen, 2019-01-30 This comprehensive volume provides teachers, researchers, and education professionals with cutting edge knowledge developed in the last decades by the educational, behavioural, and neurosciences, integrating cognitive, developmental, and socioeconomic approaches to deal with the problems children face in learning mathematics. The neurocognitive mechanisms and the cognitive processes underlying acquisition of arithmetic abilities and their significance for education have been the subject of intense research in the last few decades, but the most part of this research has been conducted in non-applied settings and there is still a deep discrepancy between the level of scientific knowledge and its implementation into actual educational settings. Now it is time to bring the results from the laboratory to the classroom. Apart from bringing the theoretical discussions to educational settings, the volume presents a wide range of methods for early detection of children with risks in mathematics learning and strategies to develop effective interventions based on innovative cognitive test instruments. It also provides insights to translate research knowledge into public policies in order to address socioeconomic issues. And it does so from an international perspective, dedicating a whole section to the cultural diversity of mathematics learning difficulties in different parts of the world. All of this makes the *International Handbook of Mathematical Learning Difficulties* an essential tool for those involved in the daily struggle to prepare the future generations to succeed in the global knowledge society.

Oxford Handbook of Numerical Cognition Roi Kadosh, Ann Dowker, 2015-07-30 How do we understand numbers? Do animals and babies have numerical abilities? Why do some people fail to grasp numbers and how we can improve numerical understanding? Numbers are vital to so many areas of life: in science, economics, sports, education, and many aspects of everyday life from infancy onwards. Numerical cognition is a vibrant area that brings together scientists from different and diverse research areas: e.g. neuropsychology, cognitive psychology, developmental psychology, comparative psychology, anthropology, education, and neuroscience, using different methodological approaches: e.g. behavioral studies of healthy children and adults and of patients, electrophysiology and brain imaging studies in humans, single cell neurophysiology in non-human primates, habituation studies in human infants and animals, and computer modeling. While the study of numerical cognition had been relatively neglected for a long time, during the last decade there has been an explosion of studies and new findings. This has resulted in an enormous advance in our understanding of the neural and cognitive mechanisms of numerical cognition. In addition, there has recently been increasing interest and concern about pupils' mathematical achievement in many countries, resulting in attempts to use research to guide mathematics instruction in schools and to develop interventions for children with mathematical difficulties. This handbook brings together the different research areas that make up the field of numerical cognition in one comprehensive and authoritative volume. The chapters provide a broad and extensive review that is written in an accessible form for scholars and students as well as educationalists.
