Planning and Decision Making for Aerial Robots Yasmina Bestaoui Sebbane, 2014-01-10 This book provides an introduction to the emerging field of planning and decision making for aerial robots An aerial robot is the ultimate form of Unmanned Aerial Vehicle an aircraft endowed with built in intelligence requiring no direct human control and able to perform a specific task It must be able to fly within a partially structured environment to react and adapt to changing environmental conditions and to accommodate for the uncertainty that exists in the physical world An aerial robot can be termed as a physical agent that exists and flies in the real 3D world can sense its environment and act on it to achieve specific goals So throughout this book an aerial robot will also be termed as an agent Fundamental problems in aerial robotics include the tasks of spatial motion spatial sensing and spatial reasoning Reasoning in complex environments represents a difficult problem The issues specific to spatial reasoning are planning and decision making Planning deals with the trajectory algorithmic development based on the available information while decision making determines priorities and evaluates potential environmental uncertainties The issues specific to planning and decision making for aerial robots in their environment are examined in this book and categorized as

follows motion planning deterministic decision making decision making under uncertainty and finally multi robot planning A variety of techniques are presented in this book and a number of relevant case studies are examined The topics considered in this book are multidisciplinary in nature and lie at the intersection of Robotics Control Theory Operational Research and Artificial Intelligence

Foundations of Artificial Intelligence and Robotics Wendell H. Chun, 2024-12-24 Artificial intelligence AI is a complicated science that combines philosophy cognitive psychology neuroscience mathematics and logic logicism economics computer science computability and software Meanwhile robotics is an engineering field that compliments AI There can be situations where AI can function without a robot e.g Turing Test and robotics without AI e.g teleoperation but in many cases each technology requires each other to exhibit a complete system having smart robots and AI being able to control its interactions i.e. effectors with its environment This book provides a complete history of computing AI and robotics from its early development to state of the art technology providing a roadmap of these complicated and constantly evolving subjects Divided into two volumes covering the progress of symbolic logic and the explosion in learning deep learning in natural language and perception this first volume investigates the coming together of AI the mind and robotics the body and discusses the state of AI today Key Features Provides a complete overview of the topic of AI starting with philosophy psychology neuroscience and logicism and extending to the action of the robots and AI needed for a futuristic society Provides a holistic view of AI and touches on all the misconceptions and tangents to the technologies through taking a systematic approach Provides a glossary of terms list of notable people and extensive references Provides the interconnections and history of the progress of technology for over 100 years as both the hardware Moore's Law GPUs and software i.e. generative AI have advanced Intended as a complete reference this book is useful to undergraduate and postgraduate students of computing as well as the general reader It can also be used as a textbook by course convenors If you only had one book on AI and robotics this set would be the first reference to acquire and learn about the theory and practice
