Question: What is the function of output statement?

Answer: To override the default way in which the DATA step writes observations to output, you can use an **OUTPUT statement** in the DATA step. Placing an explicit OUTPUT statement in a DATA step overrides the automatic output, so that observations are added to a data set only when the explicit OUTPUT statement is executed.

Question: What is the function of Stop statement?

Answer: **Stop statement** causes SAS to stop processing the current data step immediately and resume processing statement after the end of current data step.

Question : What is the difference between using **drop= data set option** in data statement and set statement?

Answer: If you don't want to process certain variables and you do not want them to appear in the new data set, then specify drop= data set option in the set statement.

Whereas If want to process certain variables and do not want them to appear in the new data set, then specify drop= data set option in the data statement.

Question: Given an unsorted dataset, how to read the last observation to a new data set?

Answer: using end= data set option.
