## CORE DRILLING

Core drilling can be considered both a geological and geophysical technique and can be used to determine the true vertical orientation of a target. The information and accuracy of the results are the foundation of seismic. Core drilling also provides the location of structural trap potential. Core drills are used frequently to measure aquifer thickness where the seismic may be skewed (caused by ground movement) due to depth. The two locations are connected and measured by continuous and geophysical to measure geophysical (density, porosity, and magnetic) structural trends. Seismic responses are of the most significant and costly methods employed throughout exploration since they are usually every decade.

## SEISMIC

Seismic behaviour data normally has velocity, travel distance, and frequency to vary velocity, dip and the efficiency of a geophysical response. The seismic response is a function of the seismic response. Seismic waves travel through the subsurface and are reflected back to the surface. The seismic response is a function of the seismic response. Seismic waves travel through the subsurface and are reflected back to the surface.
