

GC Troubleshooting Guide

Your guide to solving common problems and staying productive

Checking the Basics

Solving a number of problems made fairly simple and often overlooked components of the GC system in analysis. Many of these items are common to the daily operation of the GC and are often taken for granted (but don't forget it!). The areas and items to check include:

- Check pressure, carrier gas storage (flow velocity and flow rate) (check with inert helium purge)
- Temperature column, reactor, detector and sample tray
- System elements purge activation times, detector activation and purge flow ranges etc.
- Gas lines and traps (check flow, leaks and expiration)
- Injector consumables (new liners, O-rings and ferrules)
- Sample integrity (contamination, degradation, solvent and storage)
- Samples handling (solvents, leaks, needle changes, and cleanliness)
- Data system, settings and connections

Condensation Test

Use the test chamber (injector or carrier gas condensation systems are included) (e.g. great peaks or ghost loading)

1. Leave the GC between 40 to 50 °C for 30 or more hours
2. Run a blank analysis (i.e. run the GC) but with the system using the normal temperature conditions and instrument settings
3. Collect the chromatogram for the blank run
4. Immediately repeat the blank run (stop the flow and a completed) (do not allow more than 5 minutes to elapse before starting the second blank run)
5. Collect the chromatogram for the second blank run and compare it to the first chromatogram.
6. If the first chromatogram contains a large amount of peaks and loading instability, the morning carrier gas line or the carrier gas is contaminated.
7. If both chromatograms contain few peaks or little loading (PFI, the carrier gas and morning carrier gas flow are relatively clean)
