

## EXPERIMENTS 1 & 2: ELECTRIC FIELD MAPPING

**NOTE:** The procedure for Exp. 1 begins on page 2 and the procedure for Exp. 2 begins on page 5.

**Object:** To determine the nature of the electric field and equipotentials of a dipole and the relationship between them. In addition, time permitting to investigate the same quantities for other charge arrangements.

**Discussion:** The region near a charged body will influence the motion of another charge brought into that region. The nature of the influence is given by the electric field  $\mathbf{E}$ . The force on a charge in the presence of that electric field is will do work to move the charge (force times distance). It can be shown that the electric force is conservative, therefore a potential energy/unit charge can be defined. This potential energy may be represented by a contour map of lines of equal potential. The relationship between the potential and the field is given by vector mathematics as *the negative of the gradient of the potential is equal to the field.* (See the chapter on electric potential in your text.)

The map of an electric dipole is shown in the figure below. The solid lines represent the electric field and the dashed lines represent the equipotentials.

### Overview:

The laboratory is divided into two experiments. First is a computer simulation of the field and equipotential plots for point charge distributions defined by the experimenter. The second experiment is to use the Overbeck Field Mapping apparatus to experimentally determine the equipotential lines, and **then to sketch the corresponding electric field.**
