THERMAL DESIGN OF THE ITER VACUUM VESSEL COOLING SYSTEM. ,2010 RELAP5 3D models of the ITER Vacuum Vessel VV Primary Heat Transfer System PHTS have been developed The design of the cooling system is described in detail and RELAP5 results are presented Two parallel pump heat exchanger trains comprise the design one train is for full power operation and the other is for emergency operation or operation at decay heat levels All the components are located inside the Tokamak building a significant change from the original configurations The results presented include operation at full power decay heat operation and baking operation The RELAP5 3D results confirm that the design can operate satisfactorily during both normal pulsed power operation and decay heat operation All the temperatures in the coolant and in the different system components are maintained within acceptable operating limits [ITER Vacuum Vessel Design \(D201 Subtask 1.3 and Subtask 3\). Final Report](#) ,2001 ITER Task No D201 Vacuum Vessel Design Subtask 1 3 and Subtask 3 was initiated to propose and evaluate local vacuum vessel reinforcement alternatives in proximity to the Neutral Beam Radial Mid Plane Top and Divertor Ports These areas were reported to be highly stressed regions based on the results of preliminary stress analyses performed by the USHT US Home Team and the ITER Joint Central Team JCT at the Garching JWS Joint Work Site Initial design activities focused on the divertor port region which was reported to experience the highest stress intensities Existing stress analysis models and results were reviewed with the USHT stress analysts to obtain an overall understanding of the vessel response to the various applied loads These reviews indicated that the reported stress intensities in the divertor port region were significantly affected by the loads applied to the vessel in adjacent regions **Iter Physics**

C Wendell Horton, Jr, Sadruddin Benkadda, 2015-06-25 The promise of a vast and clean source of thermal power drove physics research for over fifty years and has finally come to collimation with the international consortium led by the European Union and Japan with an agreement from seven countries to build a definitive test of fusion power in ITER It happened because scientists since the Manhattan project have envisioned controlled nuclear fusion in obtaining energy with no carbon dioxide emissions and no toxic nuclear waste products This large toroidal magnetic confinement ITER machine is described from confinement process to advanced physics of plasma wall interactions where pulses erupt from core plasma blistering the machine walls Emissions from the walls reduce the core temperature which must remain ten times hotter than the 15 million degree core solar temperature to maintain ITER fusion power The huge temperature gradient from core to wall that drives intense plasma turbulence is described in detail Also explained are the methods designed to limit the growth of small magnetic islands the growth of edge localized plasma plumes and the solid state physics limits of the stainless steel walls of the confinement vessel from the burning plasma Designs of the wall coatings and the special exhaust pipe for spent hot plasma are provided in two chapters And the issues associated with high energy neutrons about 10 times higher than in fission reactions and how they are managed in ITER are detailed
