Fortier,1986   *Distributed Real-Time Systems* K. Erciyes,2019-07-23 This classroom tested textbook describes the design and implementation of software for distributed real time systems using a bottom up approach The text addresses common challenges faced in software projects involving real time systems and presents a novel method for simply and effectively performing all of the software engineering steps Each chapter opens with a discussion of the core concepts together with a review of the relevant methods and available software This is then followed with a description of the implementation of the concepts in a sample kernel complete with executable code Topics and features introduces the fundamentals of real time systems including real time architecture and distributed real time systems presents a focus on the real time operating system covering the concepts of task memory and input output management provides a detailed step by step construction of a real time operating system kernel which is then used to test various higher level implementations describes periodic and aperiodic scheduling resource management and distributed scheduling reviews the process of application design from high level design methods to low level details of design and implementation surveys real time

programming languages and fault tolerance techniques includes end of chapter review questions extensive C code numerous examples and a case study implementing the methods in real world applications supplies additional material at an associated website Requiring only a basic background in computer architecture and operating systems this practically oriented work is an invaluable study aid for senior undergraduate and graduate level students of electrical and computer engineering and computer science The text will also serve as a useful general reference for researchers interested in real time systems
