Measurement and instrumentation are fundamental elements of many engineering projects From research to development to manufacturing to user products engineers are constantly needing to measure things brightness of a light dimensions of an object separation between things frequency content stress strain pressure voltage etc In the real world measuring systems are not perfect so the results of a measurement are only an estimate of the true value Instrumentation for making measurements relies on some fundamental assumptions to ensure the veracity of the measurements Some key elements are bandwidth sampling rate dynamic range sensor type etc This text discusses the basic concepts of what a measurement is how the instrumentation chosen or developed can affect the measurement and how to deal with the measurement error that is in all instrumentation systems Topics include data acquisition signal conditioning sensor types and measurement noise and its various noise distributions The text concludes with three user projects that bring together these topics into an informative work that reinforces the theory

technicians work on pneumatics electronic instruments digital logic devices and computer based process controls Because so much of their work involves computerized devices they need an extensive knowledge of electronics and most have degrees in electronics technology Most textbooks in this area are written for four year institutions and lack the practical flavor that is needed in technical schools or community colleges Designed as a text for use in community colleges or vocational schools this up to date text is unsurpassed in its treatment of such subjects as instruments and parameters electrical components both analog and digital various types of actuators and regulators plumbing and instrumentation diagrams and Operation of process controllers
