

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other applications as all these are compressed. These concepts show 2 gaskets which distribute load. One is a gasket which supports the application as all these are made compressible and to increase the quality. A gasket is used to maintain the pressure in a cylinder or other seal-off in place or a liquid throughout the life cycle application. The gasket compresses to the application to increase the sealing surface for the seal. This is done by creating a seal-off between the gasket and the application between the mating surfaces. If the gasket is not compressed, the gasket will not seal through the life of the application and would be replaced by a gasket.

In order to determine the application requirements, the gasket designer is required to determine the gasket requirements in detail. Every gasket application is unique and every application requires that the gasket be selected to meet the requirements of the application or the gasket is not suitable for the application.
