Hendrix, Boglárka G.-Tóth, 2010-04-27 Nonlinear Optimization is an intriguing area of study where mathematical theory algorithms and applications converge to calculate the optimal values of continuous functions Within this subject Global Optimization aims at finding global optima for difficult problems in which many local optima might exist This book provides a compelling introduction to global and non linear optimization providing interdisciplinary readers with a strong background to continue their studies into these and other related fields The book offers insight in relevant concepts such as region of attraction and Branch and Bound by elaborating small numerical examples and exercises for the reader to follow

Introduction to Methods for Nonlinear Optimization Luigi Grippo, Marco Sciandrone, 2023-05-27 This book has two main objectives to provide a concise introduction to nonlinear optimization methods which can be used as a textbook at a graduate or upper undergraduate level to collect and organize selected important topics on optimization algorithms not easily found in textbooks which can provide material for advanced courses or can serve as a reference text for self study and research The

basic material on unconstrained and constrained optimization is organized into two blocks of chapters basic theory and optimality conditions unconstrained and constrained algorithms These topics are treated in short chapters that contain the most important results in theory and algorithms in a way that in the authors experience is suitable for introductory courses A third block of chapters addresses methods that are of increasing interest for solving difficult optimization problems Difficulty can be typically due to the high nonlinearity of the objective function ill conditioning of the Hessian matrix lack of information on first order derivatives the need to solve large scale problems In the book various key subjects are addressed including exact penalty functions and exact augmented Lagrangian functions non monotone methods decomposition algorithms derivative free methods for nonlinear equations and optimization problems The appendices at the end of the book offer a review of the essential mathematical background including an introduction to convex analysis that can make part of an introductory course

Practical Nonconvex Nonsmooth Optimization Frank E. Curtis, Daniel P. Robinson, 2025-12-05

This book provides a clear and accessible introduction to an important class of problems in mathematical optimization those involving continuous functions that may be nonconvex nonsmooth or both The authors begin with an intuitive treatment of theoretical foundations including properties of nonconvex and nonsmooth functions and conditions for optimality They then offer a broad overview of the most effective and efficient algorithms for solving such problems with a focus on practical applications in areas such as control systems signal processing and data science Practical Nonconvex Nonsmooth Optimization focuses on problems in finite dimensional real vector spaces avoiding the need for a background in functional analysis It introduces concepts through nonconvex smooth optimization making the material more accessible to those without extensive experience in convex analysis A conversational tone is used throughout with technical proofs placed at the end of each chapter to help readers understand the core ideas before engaging with detailed arguments This book is intended for advanced undergraduates and graduate students who are familiar with basic optimization concepts and are ready to explore more complex problems A background in calculus real analysis linear algebra and probability is recommended It is appropriate for an introductory graduate level course in continuous optimization Practitioners and early career researchers will also find the book useful
