

## A Compilation of Analytic Geometry Formulas with Examples and Detailed Solutions

Analytic geometry is a branch of mathematics that combines geometry with algebra, allowing us to study geometric shapes and properties using equations and coordinates. In this article, we will explore a collection of important analytic geometry formulas, along with examples and comprehensive solutions to help you understand and apply these essential principles effectively.

### 1. Distance Formula

The distance between two points in a Cartesian coordinate system can be found using the distance formula:

**Distance Formula:** If two points have coordinates  $(x_1, y_1)$  and  $(x_2, y_2)$ , then the distance between them is given by:

$$D = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

**Example Problem 1:** Find the distance between points A(2, 3) and B(5, 7).

**Solution:** Using the distance formula,  $D = \sqrt{((5 - 2)^2 + (7 - 3)^2)} = \sqrt{(3^2 + 4^2)} = \sqrt{(9 + 16)} = \sqrt{25} = 5$ .

So, the distance between points A and B is 5 units.

### 2. Midpoint Formula

The midpoint between two points with coordinates  $(x_1, y_1)$  and  $(x_2, y_2)$  can be found using the midpoint formula:

**Midpoint Formula:** The midpoint M has coordinates:

$$M(x, y) = ((x_1 + x_2) / 2, (y_1 + y_2) / 2)$$

**Example Problem 2:** Find the midpoint between points P(3, 2) and Q(7, 6).

**Solution:** Using the midpoint formula,  $M = ((3 + 7) / 2, (2 + 6) / 2) = (5, 4)$ .

**Computing Qualitatively Correct Approximations of Balance Laws** Laurent Gosse, 2013-03-30 Substantial effort has been drawn for years onto the development of possibly high order numerical techniques for the scalar homogeneous conservation law an equation which is strongly dissipative in  $L^1$  thanks to shock wave formation Such a dissipation property is generally lost when considering hyperbolic systems of conservation laws or simply inhomogeneous scalar balance laws involving accretive or space dependent source terms because of complex wave interactions An overall weaker dissipation can reveal intrinsic numerical weaknesses through specific nonlinear mechanisms Hugoniot curves being deformed by local averaging steps in Godunov type schemes low order errors propagating along expanding characteristics after having hit a discontinuity exponential amplification of truncation errors in the presence of accretive source terms This book aims at presenting rigorous derivations of different sometimes called well balanced numerical schemes which succeed in reconciling high accuracy with a stronger robustness even in the aforementioned accretive contexts It is divided into two parts one dealing with hyperbolic systems of balance laws such as arising from quasi one dimensional nozzle flow computations multiphase WKB approximation of linear Schrödinger equations or gravitational

Navier Stokes systems Stability results for viscosity solutions of onedimensional balance laws are sketched The other being entirely devoted to the treatment of weakly nonlinear kinetic equations in the discrete ordinate approximation such as the ones of radiative transfer chemotaxis dynamics semiconductor conduction spray dynamics or linearized Boltzmann models Caseology is one of the main techniques used in these derivations Lagrangian techniques for filtration equations are evoked too Two dimensional methods are studied in the context of non degenerate semiconductor models *Christian Home*
