*Directions:* Read the passage. Then answer the questions below.

## Summer Rain

The worst days of any summer are the rainy ones. We spend all year looking forward to nice weather and long, hot days. All of winter, with its dreary gray days and bitter cold, we dream of those endless days at the beach, laying on the sand and soaking in the bright and burning sun. And then, summer comes, and it rains.

As a child, I would wake up to rainy summer days and come close to crying. It wasn't fair. We suffered through months of school and miserable weather for those scant ten weeks of freedom and balmy weather. Any day that I could not spend at the beach or playing ball with my friends seemed like a punishment for something I didn't even do.

On those rainy summer days, I had nothing fun to do and could only sit inside, staring out at the rain like a Dickensian orphan. I was an only child, so there was no one else to play with. My father worked from home, so I was not truly alone, but he could not actively play with me since he was technically at work. It was those days that I would resign myself to whatever was on television or any books that I could find lying around. I'd crawl through the day and pray each night that the rain would not be there the next day.

As an adult, though, my opinion of summer rain has changed. When you have to work every day, summer is not as eagerly anticipated. Mostly, the days run together, bleeding into each other so that they no longer seem like separate entities and instead feel like continuations of the same long day. Everything seems monotonous and dull, and an ennui or listlessness kicks in. Such a mindset makes you cheer for anything new or different. I spend the winter dreaming of summer and the summer dreaming of winter. When summer comes, I complain about how hot it is. And then I look forward to the rain, because the rain brings with it a cold front, which offers a **reprieve**—admittedly one that is all too short—from the torture of 100° and humid days. Rainy days are still the worst days of the summer, but summer rain today means positively beautiful—and considerably cooler—weather tomorrow.

Changes in the weather** ,2000 *Ecophysiological Traits-Based Community Assembly and Maintenance of Ecosystem Functioning in Tropical Rainforests* Hui Zhang,Robert John,Xiang Liu ,Suping Zhou,2026-01-30 Human activities such as agriculture and mining have caused extensive deforestation and degradation of tropical rainforests reducing them to less than 50% of their pre industrial land cover With their restoration emerging as a global challenge gaining a comprehensive understanding of community assembly and maintenance of ecosystem functioning across various types of primary secondary and degraded tropical rainforests is critical for generating a roadmap on how to successfully restore degraded tropical rainforests

Functional traits have been widely proven effective for uncovering community assembly and ecosystem function maintenance in tropical rainforests. However, most studies gravitate toward easily measurable morphological traits such as specific leaf area and leaf dry matter content. Such traits are not always a proxy for ecophysiological traits which can directly determine community assembly and ecosystem function maintenance of a tropical rainforest across diverse environments and ecosystems. Therefore, it is urgent to use ecophysiological traits to better understand community assembly and maintenance of ecosystems functioning across varied tropical rainforests. This research topic aims to provide a platform for communication and integration of findings from different fields, i.e., community ecology, restoration ecology, functional ecology, and conservation biology, to deepen and expand the understanding of community assembly and ecosystem functioning in tropical rainforests and unravel the significant roles that ecophysiological traits play in directing community assembly and maintaining ecosystem functions across different tropical rainforests. We encourage the submission of theoretical and experimental studies on different tropical rainforest ecosystems such as tropical lowland rainforests, tropical cloud forests, tropical island forests, and so on. Submissions are encouraged on but not limited to the following topics: Ecophysiological trait-based community assembly and maintenance of ecosystem functioning across primary and secondary tropical rainforests; Ecophysiological traits-based community assembly and maintenance of ecosystem functioning in degraded and restored areas of tropical rainforests; Identification of ecophysiological traits that can effectively disentangle community assembly and ecosystem function maintenance in different types of tropical rainforests; Trait-based or phylogeny-based conservation strategy for highly endangered keystone species in tropical rainforests.
