

- (a) From the multiplication rule, $10^3 = 1000$ prefixes are possible
 (b) From the multiplication rule, $8 \times 2 \times 10 = 160$ are possible
 (c) Every arrangement of three digits selected from the 10 digits results in a possible prefix.

$$P_3^{10} = \frac{10!}{7!} = 720$$
 prefixes are possible.

2-46. A byte is a sequence of eight bits and each bit is either 0 or 1.

- (a) How many different bytes are possible?
 (b) If the first bit of a byte is a parity check, that is, the first byte is determined from the other seven bits, how many different bytes are possible?

- (a) From the multiplication rule, $2^8 = 256$ bytes are possible
 (b) From the multiplication rule, $2^7 = 128$ bytes are possible

2-47. In a chemical plant, 24 holding tanks are used for final product storage. Four tanks are selected at random and without replacement. Suppose that six of the tanks contain material in which the viscosity exceeds the customer requirements.

- (a) What is the probability that exactly one tank in the sample contains high-viscosity material?
 (b) What is the probability that at least one tank in the sample contains high-viscosity material?
 (c) In addition to the six tanks with high viscosity levels, four different tanks contain material with high impurities.

What is the probability that exactly one tank in the sample contains high-viscosity material and exactly one tank in the sample contains material with high impurities?

(a) The total number of samples possible is $\binom{24}{4} = \frac{24!}{4!20!} = 10,626$. The number of samples in which exactly one

tank has high viscosity is $\binom{6}{1} \binom{18}{3} = \frac{6!}{1!5!} \times \frac{18!}{3!15!} = 4896$. Therefore, the probability is

$$\frac{4896}{10626} = 0.461$$

(b) The number of samples that contain no tank with high viscosity is $\binom{18}{4} = \frac{18!}{4!14!} = 3060$. Therefore, the

$$\text{requested probability is } 1 - \frac{3060}{10626} = 0.712.$$

(c) The number of samples that meet the requirements is $\binom{6}{1} \binom{4}{1} \binom{14}{2} = \frac{6!}{1!5!} \times \frac{4!}{1!3!} \times \frac{14!}{2!12!} = 2184$.

$$\text{Therefore, the probability is } \frac{2184}{10626} = 0.206$$

2-48. Plastic parts produced by an injection-molding operation are checked for conformance to specifications. Each tool contains 12 cavities in which parts are produced, and these parts fall into a conveyor when the press opens. An inspector chooses 3 parts from among the 12 at random. Two cavities are affected by a temperature malfunction that results in parts that do not conform to specifications.

- (a) How many samples contain exactly 1 nonconforming part?
 (b) How many samples contain at least 1 nonconforming part?

Probability and Statistics by Example: Volume 1, Basic Probability and Statistics Yu. M. Suhov,Mark Kelbert,2005-10-13 Probability and Statistics are as much about intuition and problem solving as they are about theorem proving Because of this students can find it very difficult to make a successful transition from lectures to examinations to practice since the problems involved can vary so much in nature Since the subject is critical in many modern applications such as mathematical finance quantitative management telecommunications signal processing bioinformatics as well as traditional ones such as insurance social science and engineering the authors have rectified deficiencies in traditional lecture based methods by collecting together a wealth of exercises for which they have supplied complete solutions These solutions are adapted to needs and skills of students To make it of broad value the authors supply basic mathematical facts as and when they are needed and have sprinkled some historical information throughout the text

for Reliability Within the Product Life Cycle Ali Jamnia, Khaled Atua, 2019-11-13 At an early stage of the development the design teams should ask questions such as How reliable will my product be How reliable should my product be And How frequently does the product need to be repaired maintained To answer these questions the design team needs to develop an understanding of how and why their products fails then make only those changes to improve reliability while remaining within cost budget The body of available literature may be separated into three distinct categories theory of reliability and its associated calculations reliability analysis of test or field data provided the data is well behaved and finally establishing and managing organizational reliability activities The problem remains that when design engineers face the question of design for reliability they are often at a loss What is missing in the reliability literature is a set of practical steps without the need to turn to heavy statistics Executing Design for Reliability Within the Product Life Cycle provides a basic approach to conducting reliability related streamlined engineering activities balancing analysis with a high level view of reliability within product design and development This approach empowers design engineers with a practical understanding of reliability and its role in the design process and helps design team members assigned to reliability roles and responsibilities to understand how to deploy and utilize reliability tools The authors draw on their experience to show how these tools and processes are integrated within the design and development cycle to assure reliability and also to verify and demonstrate this reliability to colleagues and customers **Journal of the American Statistical Association** ,2008 **Paperbound Books in Print** ,1991 *Journal of Quality Technology* ,1995 Business Books and Serials in Print ,1977
