Tharsanee,2026-01-20 Advanced AI A Modern Technology explores the advanced concepts architectures and applications of artificial intelligence in today s digital era The subject covers deep learning neural networks natural language processing computer vision reinforcement learning and generative models It emphasizes modern AI frameworks large scale data processing and cloud based AI deployment The course also examines ethical AI explainability bias mitigation and responsible innovation It prepares learners to design develop and implement intelligent systems for real world industrial and research applications **Towards Solving Computer Vision Problems** Iljung Samuel Kwak,2019 The solution to a supervised computer vision problem consists of an application algorithm input data and a set of human generated labels Solving these kinds of tasks involves collecting large quantities of data collecting appropriate labels and developing machine vision algorithms tailored to the application Progress on these problems has often benefited from large scale datasets with high fidelity labels Successful algorithms display a synergy between application goals and the size and quality of the dataset This thesis presents work highlighting the importance of each component of a supervised vision task First the problem of automatically classifying groups of people into social categories is introduced This problem is called Urban Tribe Classification To tackle this problem each individual and the entire group of individuals are modeled Since this was a newly introduced computer vision problem a dataset for this task was created On this dataset the combined representation of group and individuals outperforms using only the person representations This model showed promising results for automatic subculture classification Second the problem of creating perceptual embeddings based on human similarity judgements is tackled This work focuses on triplet similarity comparisons of the form Is object i more similar to j or k which have been useful for computer vision and machine learning applications

Unfortunately triplet similarity comparisons like many human labeling efforts can be prohibitively expensive This work proposes two techniques for dealing with this obstacle First an alternative display for collecting triplets is designed This display shows a probe image and a grid of query images allowing the user to collect multiple triplets simultaneously The display is shown to reduce the cost and time of triplet collection In addition higher quality embeddings are created with the improved triplet collection UI A 10 000 food item dataset of human taste similarity was created using this UI Second SNaCK a low dimensional perceptual embedding algorithm that combines human expertise with automatic machine kernels is introduced Both parts are complementary human insight can capture relationships that are not apparent from the object s visual similarity and the machine can help relieve the human from having to exhaustively specify many constraints Finally the precise localization of key frames of an action is explored This work focuses on detecting the exact starting frame of a behavior an important task for neuroscience research To address this problem a loss designed to penalize extra and missed action start detections over small misalignments Recurrent neural networks RNN are trained to optimize this loss The model is shown to reduce the number of false positives an important criteria defined by the neuroscientist The performance of the model is evaluated on a new dataset the Mouse Reach Dataset a large annotated video dataset of mice performing a sequence of actions The dataset was created for neuroscience research On this dataset the proposed model outperforms related approaches and baseline methods using an unstructured loss **Smart Technologies: Breakthroughs in Research and Practice** Management Association, Information Resources,2017-06-19 Ongoing advancements in modern technology have led to significant developments with smart technologies With the numerous applications available it becomes imperative to conduct research and make further progress in this field Smart Technologies Breakthroughs in Research and Practice provides comprehensive and interdisciplinary research on the most emerging areas of information science and technology Including innovative studies on image and speech recognition human computer interface and wireless technologies this multi volume book is an ideal source for researchers academicians practitioners and students interested in advanced technological applications and developments **Assistive Technologies and Computer Access for Motor Disabilities** Kouroupetroglou, Georgios,2013-08-31 Individuals with disabilities that impede their range of motion often have difficulty accessing technologies With the use of computer based assistive technology devices tools and services can be used to maintain and improve the functional capabilities of motor disabilities Assistive Technologies and Computer Access for Motor Disabilities investigates solutions to the difficulties of impaired technology access by highlighting the principles methods and advanced technological solutions for those with motor impairments This reference source is beneficial to academia industry and various professionals in disciplines such as rehabilitation science occupational therapy human computer interface development ergonomics and teaching in inclusive and special education This publication is integrated with its pair book Disability Informatics and Web Accessibility for Motor Limitations **Computer Vision 101**
