

## Introduction to Cellular Energy and ATP

Read the following:

**Adenosine Triphosphate** or **ATP** for short is a high-energy molecule that living things use to power all of their cellular functions. You can think of ATP almost like "energy currency". Cells continuously invest a small amount of energy to build ATP molecules. This investment is returned when the cell breaks down the ATP molecules, and large amounts of energy are released.

Another analogy for how ATP works in the cell is like going to an arcade. The goal at the arcade is to win a lot of prizes. When you arrive at the arcade, you have money, but you can't use that money in the games, you have to exchange it for tokens. In this example your money is food you eat, and the tokens are ATP. You then play the games with those tokens to ultimately win tickets and prizes. The tickets and prizes in a cell would be the building blocks of proteins, RNA, DNA, and other macromolecules.

The picture below shows a simplified picture of the structure of ATP. Use this picture to answer the questions that follow.

1. Adenosine Triphosphate, ATP is an example of a nucleic acid, however it contains parts of other biological molecules we have previously discussed. One of the parts of ATP is Ribose. What type of biological molecule do you think Ribose is?

\_\_\_\_\_ RNA \_\_\_\_\_

2. Attached to the ribose sugar is a molecule called Adenine, which we will discuss later in the year when we learn about DNA structure. Also attached to the ribose sugar is 3 \_\_\_\_\_ phosphate \_\_\_\_\_ groups.

3. Now that you have an understanding of the molecular structure of ATP, why does the name "Adenosine Triphosphate" make sense? \_\_\_\_\_ Adenosine combines adenine and ribose and triphosphate makes sense because there are 3 phosphate groups \_\_\_\_\_

**ATP and the Heart** Joanne S. Ingwall, 2012-12-06 ATP plays a central role in the two leading causes of cardiac morbidity and mortality in the western world ischemia and heart failure We are in our infancy applying what is known about biology and chemistry of ATP toward developing effective therapies for these diseases In this volume the current understanding of the chemistry and biology of ATP specifically in the cardiomyocyte is presented New insights into ATP have been gleaned using biophysical techniques allowing dynamic measurement of chemical events in the intact beating heart and using new animal models in which cardiac proteins are either over expressed deleted or harbor specific mutations This book provides a summary of the basic understanding and includes illustrations of why ATP and the Heart is important to both the clinician and scientist Molecular Structure, Function, and Assembly of the ATP Synthases Sangkot Marzuki, 2012-12-06

In recent years the ATP synthase H ATPase FoFrATPase has been the subject of intensive investigations in many laboratories The major reason for this lies in the fact that this enzyme complex catalyses one of the most important reactions in living cells namely the synthesis of ATP utilizing the energy from an electrochemical transmembrane H gradient generated by the cellular respiratory chain or by the light reactions of photosynthetic organisms The mechanism by which the H motive force is utilized to drive the synthesis of ATP is one of the major unsolved problems in biochemistry Thus the fundamental information concerning the molecular structure and the mechanism of assembly of the ATP synthase is of major significance in cell biology A seminar workshop on the Molecular Structure Function and Assembly of the ATP synthases was held in April 1987 at the East West Center University of Hawaii Honolulu Hawaii to promote exchange of information between laboratories actively engaged in the study of the ATP synthases and to provide a forum for discussion and coordination of data derived from molecular genetic and biochemical approaches used in different laboratories This volume summarizes the result of the seminar workshop in the form of a collection of papers presented at the meeting and provides an overview of current work in this rapidly progressing area of research **Bioenergetics** Baltazar D. elucidate the requirements for torque generation during ATP synthesis in the holoenzyme as well as in the isolated F<sub>0</sub> part. To achieve this a quantitative H<sup>+</sup> transport assay was established. Furthermore the Na<sup>+</sup> dependent enzyme from *P. modestum* and the H<sup>+</sup> dependent ATP synthase from *E. coli* were compared with respect to torque generation and ATP synthesis. We observed that a small ion concentration gradient was indispensable for ATP synthesis in both enzymes. Much more surprising was the observation that 100 times higher Na<sup>+</sup> or H<sup>+</sup> concentrations were required for synthesis than hydrolysis of ATP. For the first time the ion concentration at the periplasmic side was recognized as critical determinant for ATP synthesis. Based on these data a model for the F type ATPases is presented.
