## NUMBER & CHARACTER

**Integer**  
 The integer data type represents whole numbers, both positive and negative. It is the most common data type used in C++ programs. The range of values that can be stored in an integer depends on the compiler and the system architecture. For example, on a 32-bit system, the range is typically from -2,147,483,648 to 2,147,483,647.

**Float**  
 The float data type represents real numbers with a fractional part. It is used for calculations involving decimal values. The range of values that can be stored in a float is typically from approximately 1.18e-38 to 3.4e+38.

**Double**  
 The double data type represents real numbers with a fractional part, similar to float, but with a higher precision. The range of values that can be stored in a double is typically from approximately 2.2e-308 to 1.8e+308.

**Character**  
 The character data type represents a single character, such as a letter, digit, or symbol. It is used for storing and manipulating individual characters. The range of values that can be stored in a character is typically from 0 to 255.

**String**  
 The string data type represents a sequence of characters. It is used for storing and manipulating text. The range of values that can be stored in a string depends on the system architecture and the compiler. For example, on a 32-bit system, the range is typically from 0 to 4,294,967,295.

**Boolean**  
 The boolean data type represents a logical value, either true or false. It is used for storing and manipulating logical values. The range of values that can be stored in a boolean is typically from 0 to 1.

**Enum**  
 The enum data type represents a set of named constants. It is used for storing and manipulating discrete values. The range of values that can be stored in an enum depends on the compiler and the system architecture. For example, on a 32-bit system, the range is typically from 0 to 4,294,967,295.

**Complex**  
 The complex data type represents a complex number, which has both a real and an imaginary part. It is used for calculations involving complex numbers. The range of values that can be stored in a complex number depends on the compiler and the system architecture.

**Pointer**  
 The pointer data type represents the memory address of another variable. It is used for storing and manipulating memory addresses. The range of values that can be stored in a pointer depends on the system architecture. For example, on a 32-bit system, the range is typically from 0 to 4,294,967,295.

**Array**  
 The array data type represents a collection of elements of the same data type. It is used for storing and manipulating multiple values of the same type. The range of values that can be stored in an array depends on the compiler and the system architecture.

**Vector**  
 The vector data type represents a dynamic array of elements of the same data type. It is used for storing and manipulating multiple values of the same type. The range of values that can be stored in a vector depends on the compiler and the system architecture.

**Map**  
 The map data type represents a collection of key-value pairs. It is used for storing and manipulating data where each value is associated with a unique key. The range of values that can be stored in a map depends on the compiler and the system architecture.

**Set**  
 The set data type represents a collection of unique elements. It is used for storing and manipulating multiple values of the same type. The range of values that can be stored in a set depends on the compiler and the system architecture.

**Queue**  
 The queue data type represents a collection of elements that are added to the end and removed from the front. It is used for storing and manipulating multiple values of the same type. The range of values that can be stored in a queue depends on the compiler and the system architecture.

**Stack**  
 The stack data type represents a collection of elements that are added to the top and removed from the top. It is used for storing and manipulating multiple values of the same type. The range of values that can be stored in a stack depends on the compiler and the system architecture.
