The Next Generation of Electric Power Unit Commitment Models Benjamin F. Hobbs, Michael H. Rothkopf, Richard P. O'Neill, Hung-po Chao, 2006-04-11 Over the years the electric power industry has been using optimization methods to help them solve the unit commitment problem The result has been savings of tens and perhaps hundreds of millions of dollars in fuel costs Things are changing however Optimization technology is improving and the industry is undergoing radical restructuring Consequently the role of commitment models is changing and the value of the improved solutions that better algorithms might yield is increasing The dual purpose of this book is to explore the technology and needs of the next generation of computer models for aiding unit commitment decisions Because of the unit commitment problem s size and complexity and because of the large economic benefits that could result from its improved solution considerable attention has been devoted to algorithm development in the book More systematic procedures based on a variety of widely researched algorithms have been proposed and tested These techniques have included dynamic programming branch and bound mixed integer programming MIP linear and network programming approaches and Benders decomposition methods among others Recently metaheuristic methods have been tested such as genetic programming and simulated annealing along with expert systems and neural networks Because electric markets are changing rapidly how UC models are solved and what purposes they serve need reconsideration Hence the book brings together people who understand the problem and people who know what improvements in algorithms are really possible The two fold result in *The Next Generation of Electric Power Unit Commitment Models* is an assessment of industry needs and new formulations and computational approaches that promise to make unit commitment models more responsive to those needs [NASA Technical Memorandum](#), 1991
