Best Informatica Interview Questions & Answers

What are the differences between Connected and Unconnected Lookup?

Connected Lookup	Unconnected Lookup
Connected lookup participates in the dataflow and receives input directly from the pipeline	Unconnected lookup receives input values from the result of a :LKP expression in another transformation
Connected lookup can return multiple columns from the same row	Unconnected lookup can return only one column from each row
Connected lookup supports user-defined default values	Unconnected lookup does not support user-defined default values
Connected lookup can be used in a mapping without a lookup transformation	Unconnected lookup must be used with a lookup transformation
Supports dynamic caching	Does not support dynamic caching

What is meant by active and passive transformation?

Informatica transformations are classified as either active or passive, depending on how they affect the number of rows that pass through them.

- **Active transformation**: An active transformation can change the number of rows that pass through it. For example, a Filter transformation is active because it removes rows that do not meet the filter condition.
- **Passive transformation**: A passive transformation does not change the number of rows that pass through it. For example, an Expression transformation that performs a calculation on data and returns the result is passive because it does not change the number of rows that pass through it.
- **Connected transformation**: A connected transformation is connected to the data flow or connected to the transformation in the mapping pipeline.
- **Unconnected transformation**: An unconnected transformation is not connected to the data flow or connected to the transformation in the mapping pipeline. It is called within another transformation, and returns a value that is used in the calculation.
