

Costal Engineering

Costal Engineering is a branch of civil engineering that deals with the design and construction of structures and systems that are exposed to the forces of the sea. This includes the design of harbours, piers, breakwaters, and coastal defences. It also involves the study of coastal erosion and the development of strategies to protect the coastline.

The main objective of costal engineering is to provide a safe and secure environment for the coastal population and to protect the natural resources of the coast. This is achieved by the design and construction of structures and systems that are able to withstand the forces of the sea. The design process involves a detailed study of the coastal environment and the forces that act upon it. This includes the study of the tides, waves, and currents, and the assessment of the risk of coastal erosion and flooding.

Costal engineering is a multidisciplinary field that involves the application of principles from civil engineering, geotechnical engineering, and environmental engineering. It is a challenging and rewarding profession that offers the opportunity to work on some of the most important and exciting projects in the world.

Meeting,1989 **Coastal Engineering** Dominic Reeve,Andrew Chadwick,Christopher Fleming,2018-03-09 Effective coastal engineering is expensive but it is not as costly as neglect or ineffective intervention Good practice needs to be based on sound principles but theoretical work and modelling also need to be well grounded in practice which is continuously evolving Conceptual and detailed design has been advanced by new industry publications since the publication of the second edition This third edition provides a number of updates the sections on wave overtopping have been updated to reflect changes brought in with the recently issued EurOtop

II manual a detailed worked example is given of the calculation of extreme wave conditions for design additional examples have been included on the reliability of structures and probabilistic design the method for tidal analysis and calculation of amplitudes and phases of harmonic constituents from water level time series has been introduced in a new appendix together with a worked example of harmonic analysis and a real life example is included of a design adapting to climate change This book is especially useful as an information source for undergraduates and engineering MSc students specializing in coastal engineering and management Readers require a good grounding in basic fluid mechanics or engineering hydraulics and some familiarity with elementary statistical concepts
