

# GEOMETRY - Part 1

segments, lines, planes, geometric formulas

## GEOMETRY HISTORY

Geometry means earth measurement. Early people used their basic knowledge of geometry to build roads, bridges, pyramids, and irrigation systems. The more formal study of geometry today is based on an interest in logical reasoning and mathematics, rather than in measurement alone. Euclid (c.300 B.C.), a legendary Greek geometer, was a brilliant volunteer set of books named **The Elements**, in which the geometric relationships were derived through deductive reasoning. Thus, the formal geometry studied today is often called **Euclidean geometry**. This geometry is also called **plane geometry** because the relationships deal with flat surfaces. Geometry has useful real terms, defined terms, postulates (statements that have not been proved, but have "worked" for thousands of years), and theorems (relationships that have been mathematically and logically proven).

## GEOMETRIC FORMULAS

**Perimeter:** The perimeter,  $P$ , of a two-dimensional shape is the sum of all side lengths. Area: The area,  $A$ , of a two-dimensional shape is the number of square units that can be put in the shape enclosed by the sides. **Area:** Area is obtained through some combination of multiplying lengths and bases, adding halves, times 20° angles will work, except in circles. **Volume:** The volume,  $V$ , of a three-dimensional object is the number of cubic units that can be put in the object enclosed by all the sides.

**Square Area:**  
 An  $s \times s$  square has  $s^2$  square units.  
 An  $s \times s$  square has  $s^2$  square units.

**Circle Area:**  
 An  $r$  circle has  $\pi r^2$  square units.  
 An  $r$  circle has  $\pi r^2$  square units.  
 An  $r$  circle has  $\pi r^2$  square units.

**Perimeter Theorem:**  
 If a circle circumscribes a square with side  $s$ , then  $P = 4s$ .

**Rectangle Theorem:**  
 A rectangle with length  $l$  and width  $w$  has  $P = 2l + 2w$ .

**Cube Volume:**  
 A cube with side length  $s$  has  $V = s^3$  cubic units.  
 A cube with side length  $s$  has  $V = s^3$  cubic units.

**Cylinder Volume:**  
 A cylinder with radius  $r$  and height  $h$  has  $V = \pi r^2 h$  cubic units.  
 A cylinder with radius  $r$  and height  $h$  has  $V = \pi r^2 h$  cubic units.

**Cone Volume:**

 A triangular prism with base  $l$  and height  $h$  has  $V = \frac{1}{2}lh \times l$  cubic units.

**Rectangular Pyramid Volume:**  
 A rectangular pyramid with base  $l$  and width  $w$  has  $V = \frac{1}{3}lw \times h$  cubic units.  
 A rectangular pyramid with base  $l$  and width  $w$  has  $V = \frac{1}{3}lw \times h$  cubic units.

**Sphere Volume:**  
 A sphere with radius  $r$  has  $V = \frac{4}{3}\pi r^3$  cubic units.  
 A sphere with radius  $r$  has  $V = \frac{4}{3}\pi r^3$  cubic units.

## DESCRIPTIONS OF UNDEFINED TERMS

### Point

- A point may be described as a location with no length, no width, and no depth.
- A point is a letter named with a capital letter. It is usually located by writing a dot above the name of a point, although the points cannot really be drawn because they have no dimensions. (See Examples 1, 2, and 3 on page 2.)

### Line

- A line may be described as a set of points going straight on forever in two opposite directions. Lines are straight and uncurved. There is no end to a line. The phrase "straight line" does not mean any straight. If something is not straight it cannot be a line. Lines are always curveless. Lines have length, but no width and no depth. Lines cannot be bent or curved. They have no thickness. Lines are always straight and go on forever in both directions. Lines are always the same in all directions. Lines are always the same in all directions. Lines are always the same in all directions.
- Lines are usually named by one or two letters. The line containing points  $K$  and  $N$  may be named by either:
  - Using only the 1-letter name, then these points on the line with a line indicator above the points. For example,  $\overleftrightarrow{KN}$  or  $\overleftrightarrow{NK}$  (the order of the letters doesn't matter). The line indicator above the capital letters always points horizontally from left to right and never in any other direction. It is the usual direction of the points in space that determines the location and direction of the line. Note the direction of the line indicator above the capital letters on the diagram.
  - By using the letters with capital letters with a number subscript. For example,  $\ell_1$  or  $\ell_2$ .

**C:** Lines in Euclidean geometry, points and the geometry of three angles, and geometric properties of lines can be described. See Algebra - Part 2.

### Planes

- A plane may be described as a set of points going on forever in all directions except for one dimension that causes depth. Imagine the very surface of a perfectly flat piece of paper extending on forever in every direction but having no thickness at all. This could be a flat structure such that when any two points in this plane are connected by a line, all points on the line are also in the plane. Planes have length and width, but no depth.
- Planes are usually referred to as "plane  $\ell$ " or "plane ABC" (any 3 points on the plane that are not on the same line) or "the plane containing  $\dots$ " (whatever points in the diagram). Planes cannot be drawn. Representations of planes are usually drawn as parallelograms, either with the arrows indicating that the planes go on forever or without the arrows even though the points do go on forever.

### Postulates

Postulates are statements that have been used and accepted for centuries without formal proof. These are postulates:  
 A. A line contains at least 2 points, and any 2 points locate exactly one line.

- A plane contains at least 3 points that are not all on the same line, and any 3 points that are not on the same line locate exactly one plane. Therefore, a line and one point not on the line also locate exactly one plane.

C. Any 3 points locate at least one plane.

- Two points of a line are in a plane, then the line is in the plane, or: If two points are in a plane then the line containing the two points is also in the plane.

E. Two planes intersect, then their intersection is a line.

## DEFINED TERMS

There are many defined terms of plane geometry. The definitions of these terms will be given by name, group, group, group, the study grade rather than grouped by one big list.

**Point:** Postulates for several are relationships and statements that have worked for centuries and are accepted as true. Relationships and statements that have been proved mathematically. Postulates and theorems are proved through logic. They are not stated and are the various parts of geometry. Sometimes they are called axioms or postulates, and sometimes they are simply stated and not labeled.

### Space

Space is the set of all points. Space goes on forever in every direction, with infinite length, width, and depth. Space has no special location. It is simply defined as space. Space contains at least 4 points that are not all on the same plane.

### General Terms

A line segment depends on the name of segment and direction. After some movement of the shape they can be made to fit exactly on top of one another.  
 Note: Corresponding parts of congruent polygons are congruent. That is, once the polygons have been moved around in such a way perfectly, then the parts that match correspondingly are congruent.
